

The Explosion of Intense Laser Activities Around the World and Related PW Activities at LLNL

**10th DOE Laser Safety Workshop
Lawrence Livermore National Laboratory
August 19, 2014**

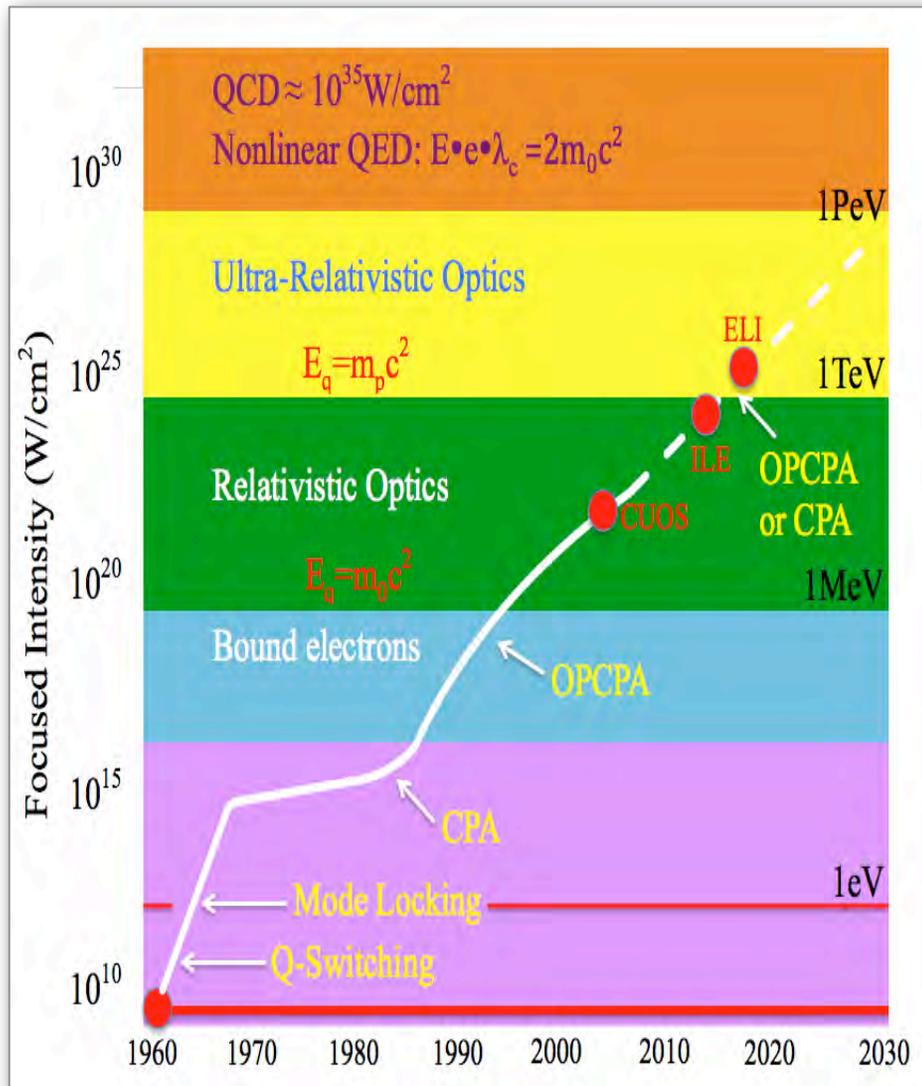

Dr. C. P. J. Barty

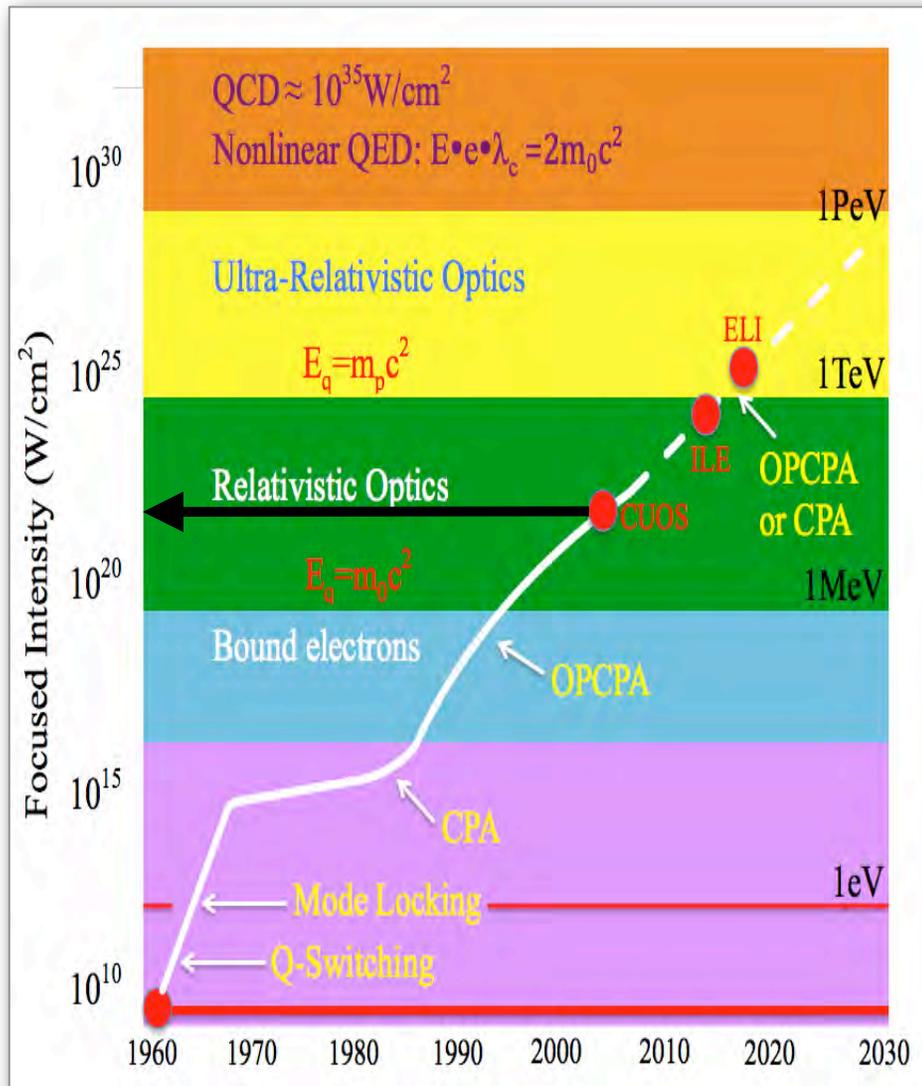

**Chief Technology Officer
National Ignition Facility and Photon Science Directorate
Lawrence Livermore National Laboratory**

**Co-chair
International Committee on Ultrahigh Intensity Lasers**

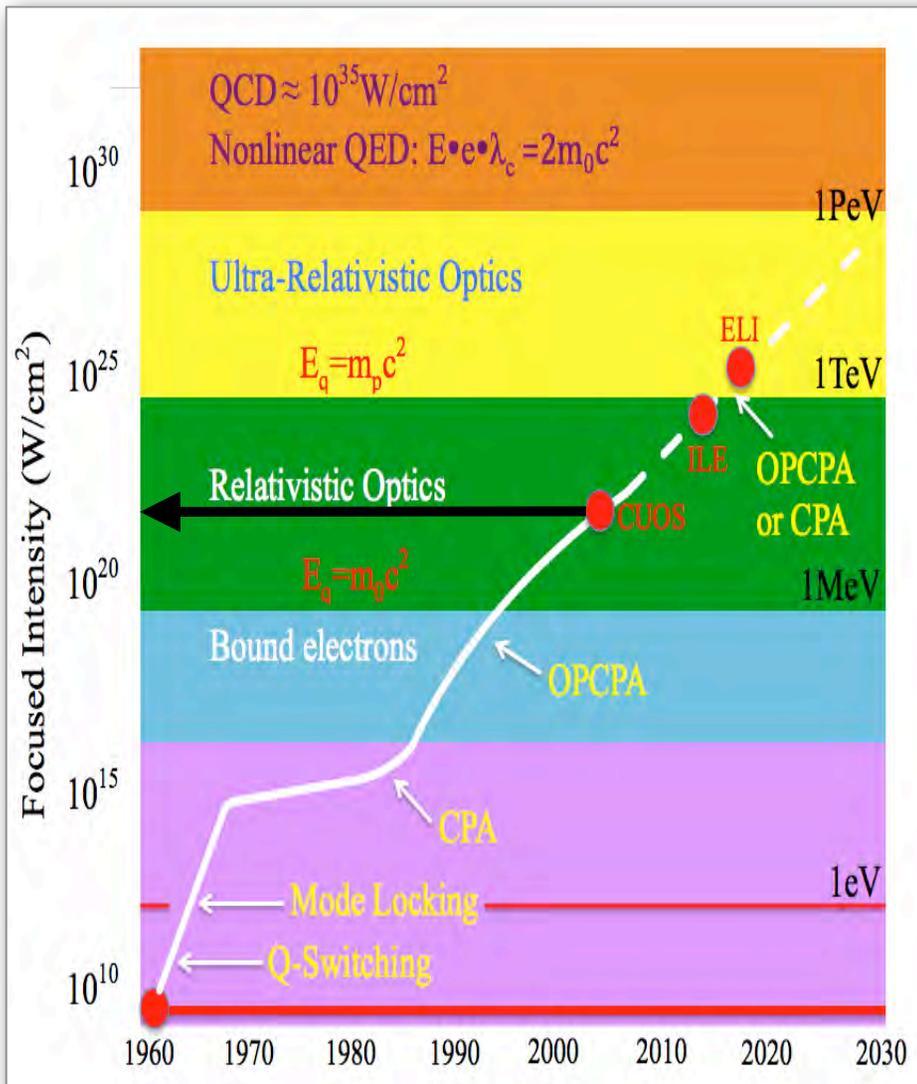

The pursuit of ultrahigh intensity science & apps is driving a world wide development of new capabilities

The pursuit of ultrahigh intensity science & apps is driving a world wide development of new capabilities

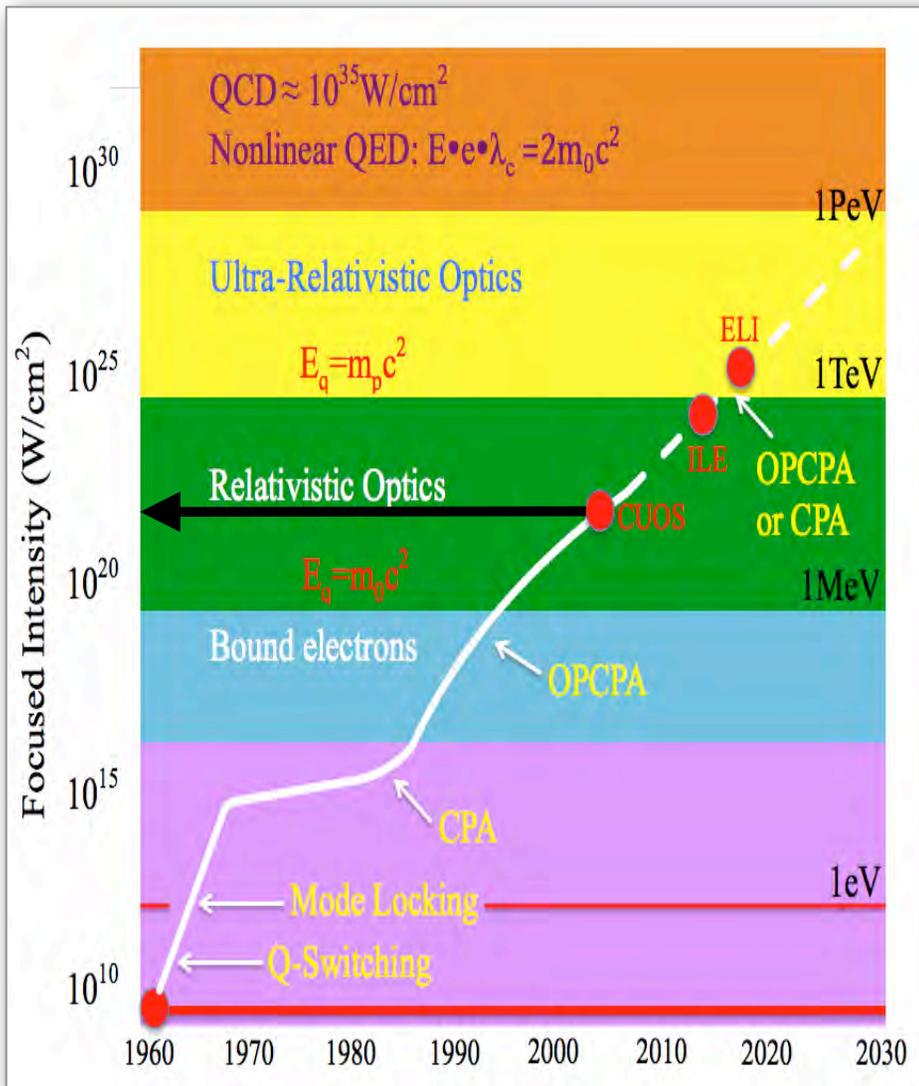

The pursuit of ultrahigh intensity science & apps is driving a world wide development of new capabilities

Opportunities at $> 10^{23} \text{ W/cm}^2$

- $3.3 \times 10^{12} \text{ J/cm}^3 = 600 \text{ Tons TNT/cm}^3 = 33 \text{ TBar photon pressure}$
- 10-GeV unguided laser plasma accelerators — table top x-ray FELS
- Relativistic proton and muon interactions — compact hadron therapy
- Ultrafast ionization — complete ionization through Zinc — U^{82+} and Pu^{85+}
- Cluster fusion — fusion materials lifetime testing
- Multi-GeV quiver energy and nuclear excitations
- e^+/e^- , p^+/p^- , pion production
- Relativistic vacuum nonlinear optics — blue photons from “nothing”!

2001 May - OECD GSF Workshop on “Compact, High Intensity, Short Pulse Lasers”

May 28-30, 2001, JAERI, Kyoto, Japan

2001 May - OECD GSF Workshop on “Compact, High Intensity, Short Pulse Lasers”
2002 Jan - Proposal to Establish OECD GSF Coordinating Committee on “CHISP” Lasers

May 28-30, 2001, JAERI, Kyoto, Japan

2001 May - OECD GSF Workshop on “Compact, High Intensity, Short Pulse Lasers”
2002 Jan - Proposal to Establish OCED GSF Coordinating Committee on “CHISP” Lasers
2002 Dec - OCED GSF Coordinating Committee on “CHISP” Lasers meets at LLNL

May 28-30, 2001, JAERI, Kyoto, Japan

2001 May - OECD GSF Workshop on “Compact, High Intensity, Short Pulse Lasers”
2002 Jan - Proposal to Establish OCED GSF Coordinating Committee on “CHISP” Lasers
2002 Dec - OCED GSF Coordinating Committee on “CHISP” Lasers meets at LLNL
2003 Sept - OCED GSF Coordinating Committee on “CHISP” Lasers defines ICUIL Charter

May 28-30, 2001, JAERI, Kyoto, Japan

2001 May - OECD GSF Workshop on “Compact, High Intensity, Short Pulse Lasers”
2002 Jan - Proposal to Establish OCED GSF Coordinating Committee on “CHISP” Lasers
2002 Dec - OCED GSF Coordinating Committee on “CHISP” Lasers meets at LLNL
2003 Sept - OCED GSF Coordinating Committee on “CHISP” Lasers defines ICUIL Charter
2003 Oct - Proposal is made to IUPAP Executive Council to form ICUIL (patterned after ICFA)

May 28-30, 2001, JAERI, Kyoto, Japan

2001 May - OECD GSF Workshop on “Compact, High Intensity, Short Pulse Lasers”
2002 Jan - Proposal to Establish OCED GSF Coordinating Committee on “CHISP” Lasers
2002 Dec - OCED GSF Coordinating Committee on “CHISP” Lasers meets at LLNL
2003 Sept - OCED GSF Coordinating Committee on “CHISP” Lasers defines ICUIL Charter
2003 Oct - Proposal is made to IUPAP Executive Council to form ICUIL (patterned after ICFA)
2004 Feb - ICUIL Kickoff Meeting (10 laser lab members, 6 user community members)

About ICUIL

Objectives

The International Committee on Ultra-High Intensity Lasers (ICUIL) is an organization concerned with international aspects of ultra-high intensity laser science, technology and education.

[History](#)

[Charter](#)

[Committee](#)

The objectives of ICUIL

- To provide a venue for discussions among representatives of high-intensity laser facilities and members of user communities, on international collaborative activities such as the development of the next generation of ultrahigh intensity lasers, exploration of new areas of fundamental and applied research, and formation of a global research network for access to advanced facilities by users.
- To promote unity and coherence in the field by convening conferences and workshops dedicated to ultrahigh intensity lasers and their applications.
- To accelerate progress in the field by sharing information, exploring opportunities for joint procurement, and exchanging equipment, ideas and personnel among laser laboratories world-wide.
- To attract students to high-field science by promoting their education and training, their interactions with prominent scientists, and access to the latest equipment, results and techniques.
- To strengthen and exploit synergy with other relevant fields and techniques, notably accelerator-based free electron lasers.

About ICUIL

ICUIL World Map Starting Points

**Reflect worldwide activity in the
“ultrahigh intensity” lasers & apps**

**Include all existing & planned
“ultrahigh intensity” facilities**

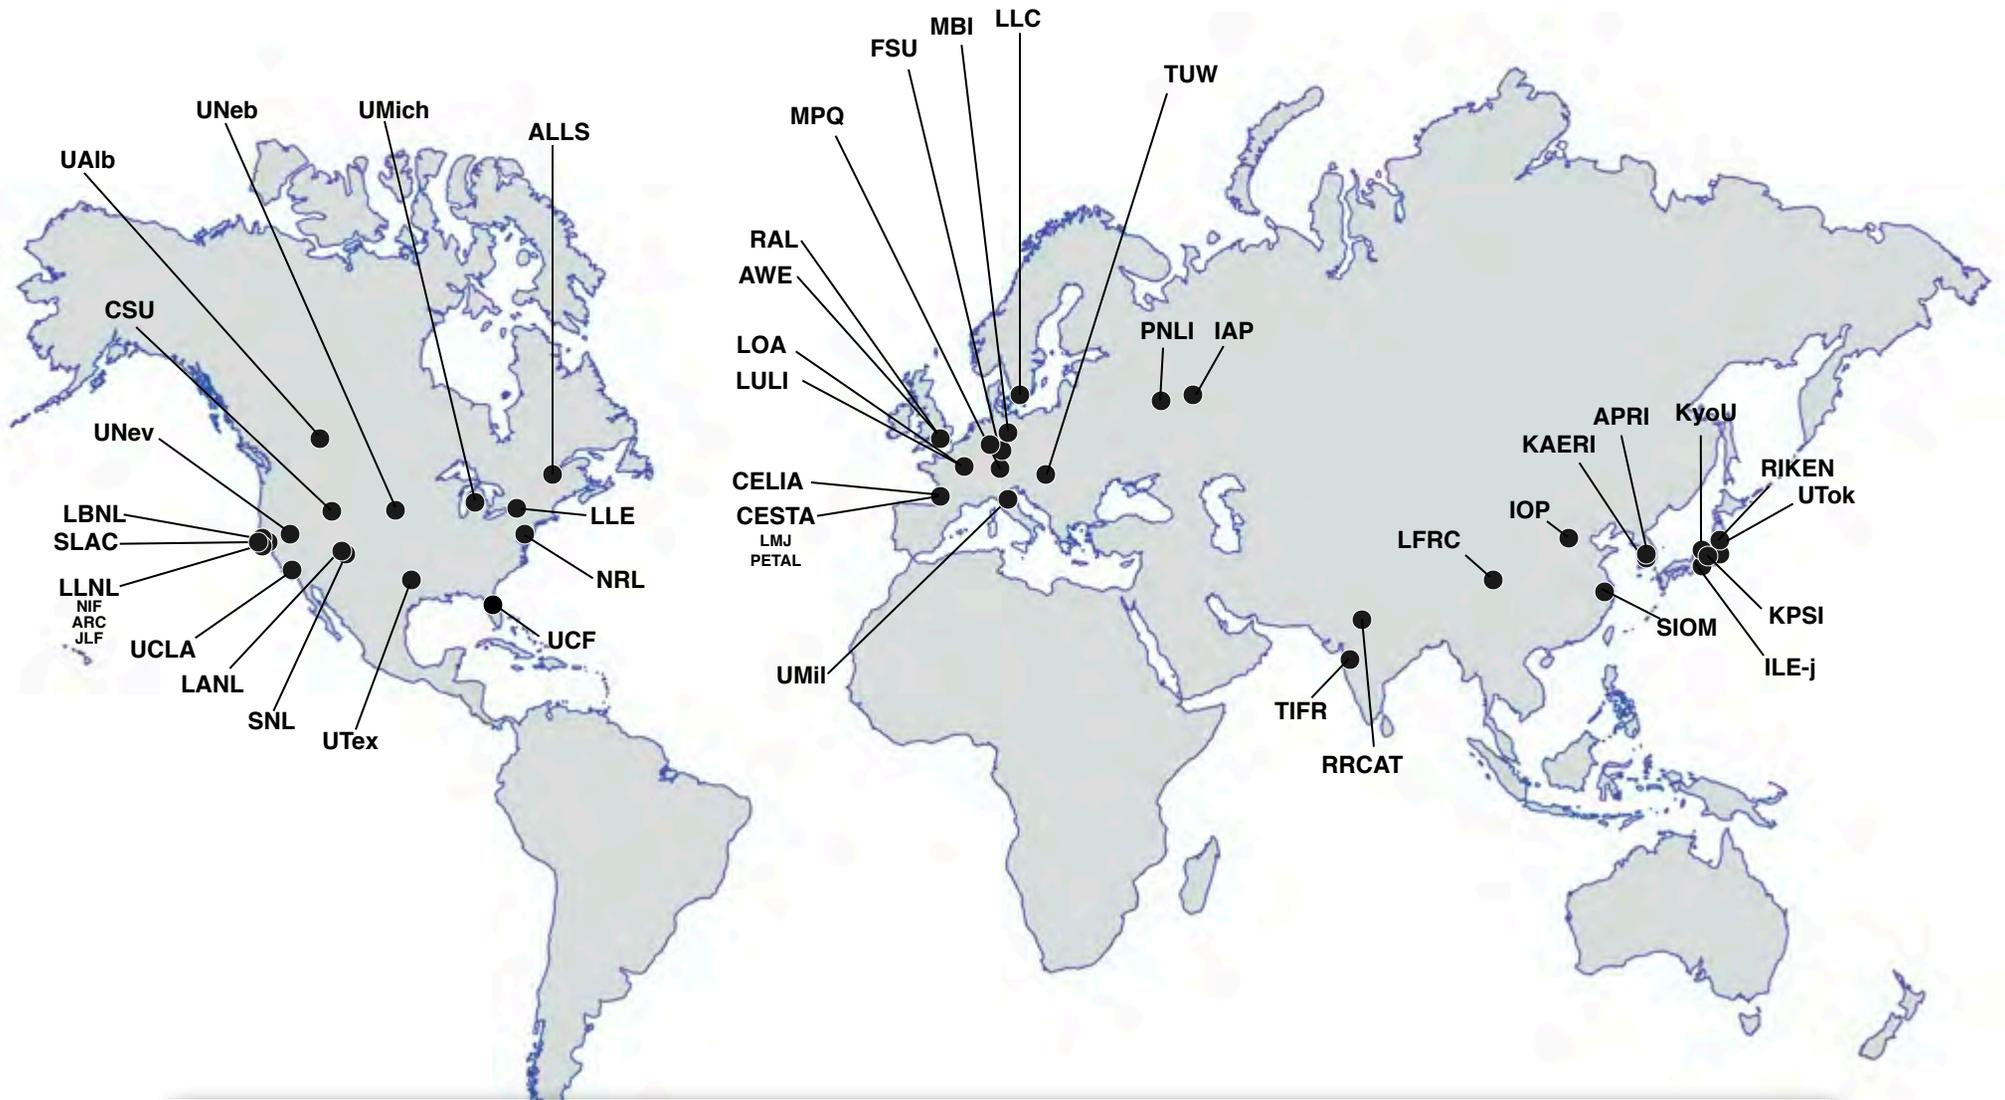

ICUIL Definition of “Ultrahigh Intensity”

**‘ultrahigh’ intensity = any laser with
focal capability within 3 orders of the
published intensity record**

**currently
 10^{19} W/cm² or ~10 TW or greater**

2009 ICUIL World Map of Ultrahigh Intensity Laser Capabilities

Labels represent the establishments with physical and administrative responsibility for the ultrahigh intensity laser system or facility

2009

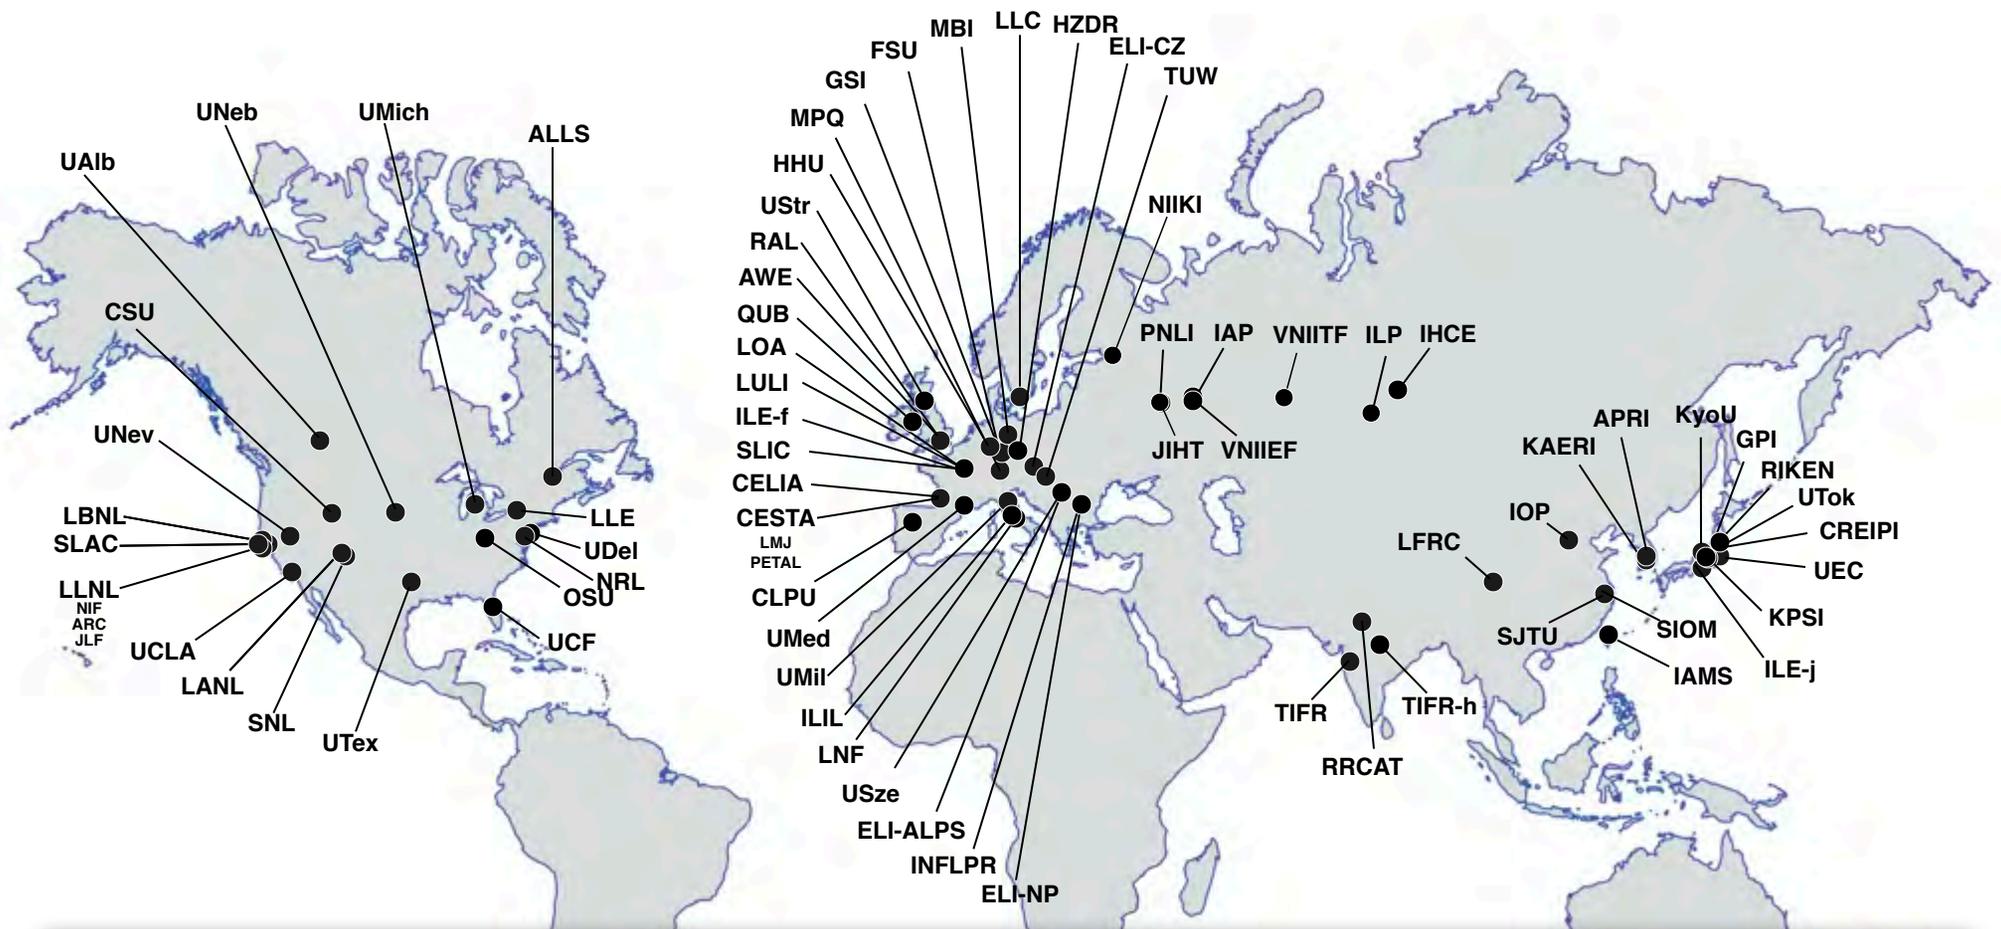

Labels represent the establishments with physical and administrative responsibility for the ultrahigh intensity laser system or facility

Today

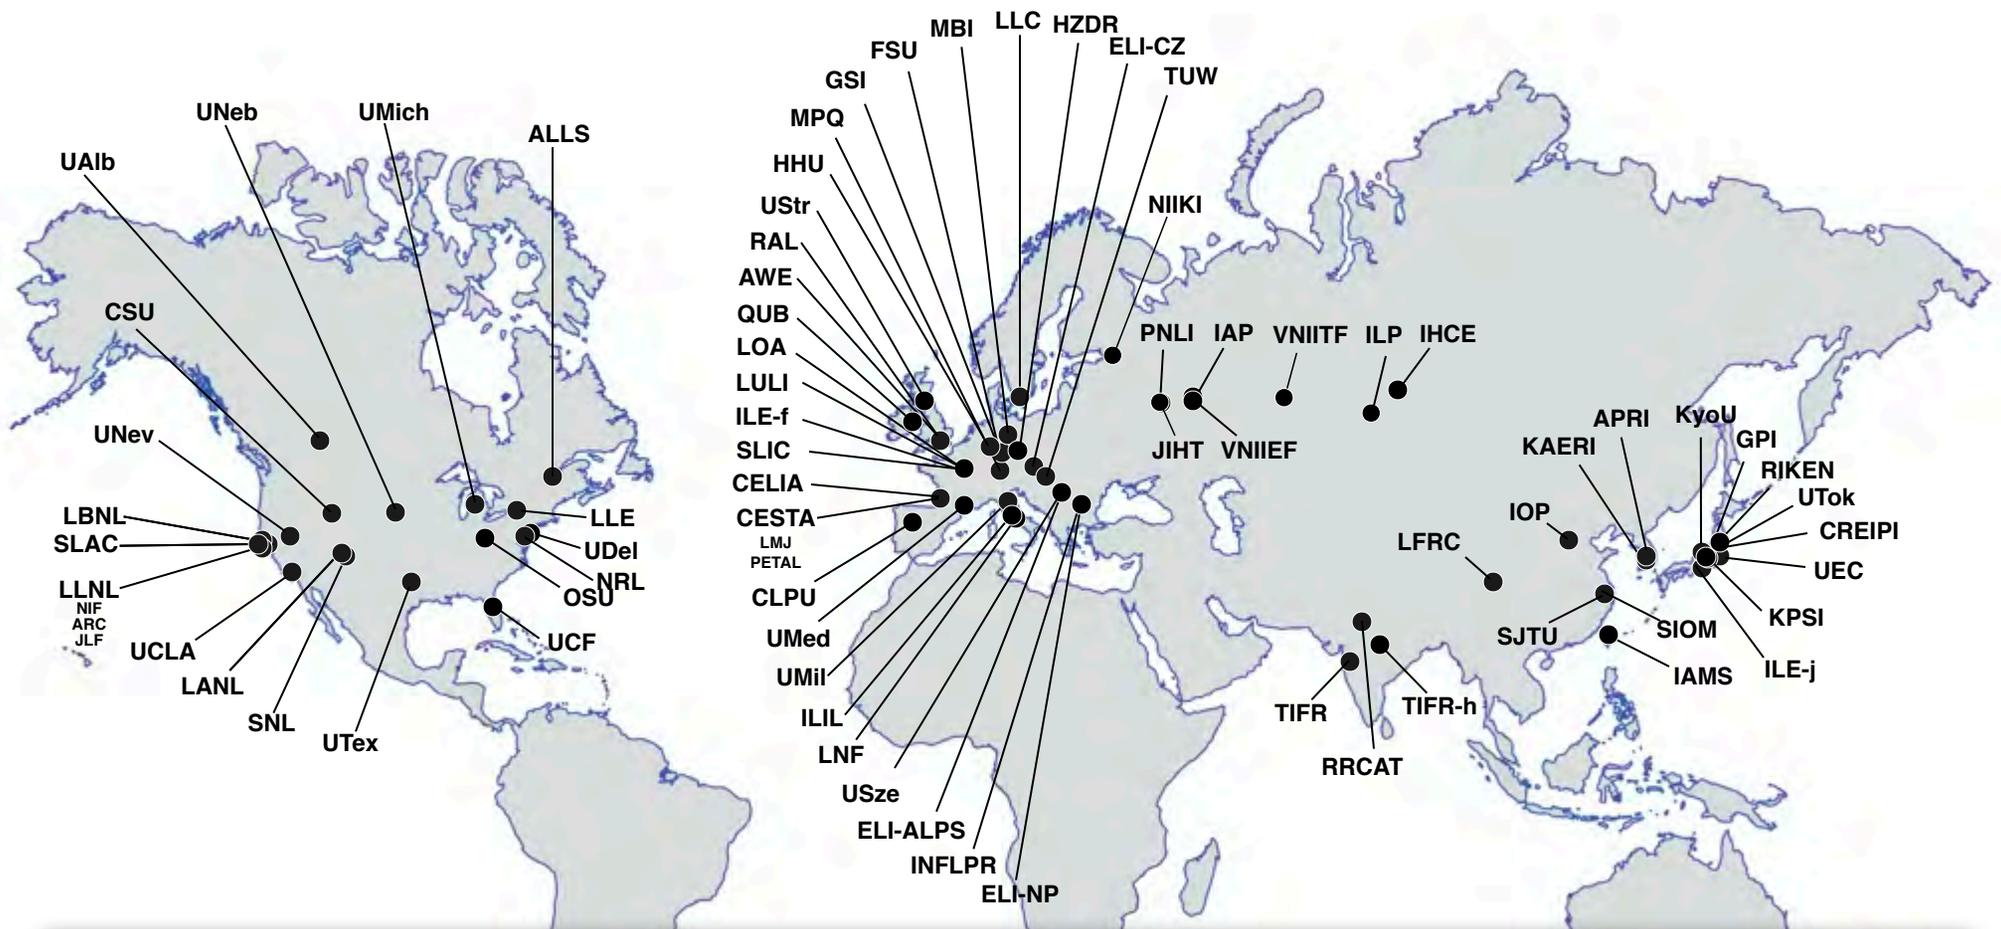

Labels represent the establishments with physical and administrative responsibility for the ultrahigh intensity laser system or facility

Present ICUIL World Map of Ultrahigh Intensity Laser Capabilities

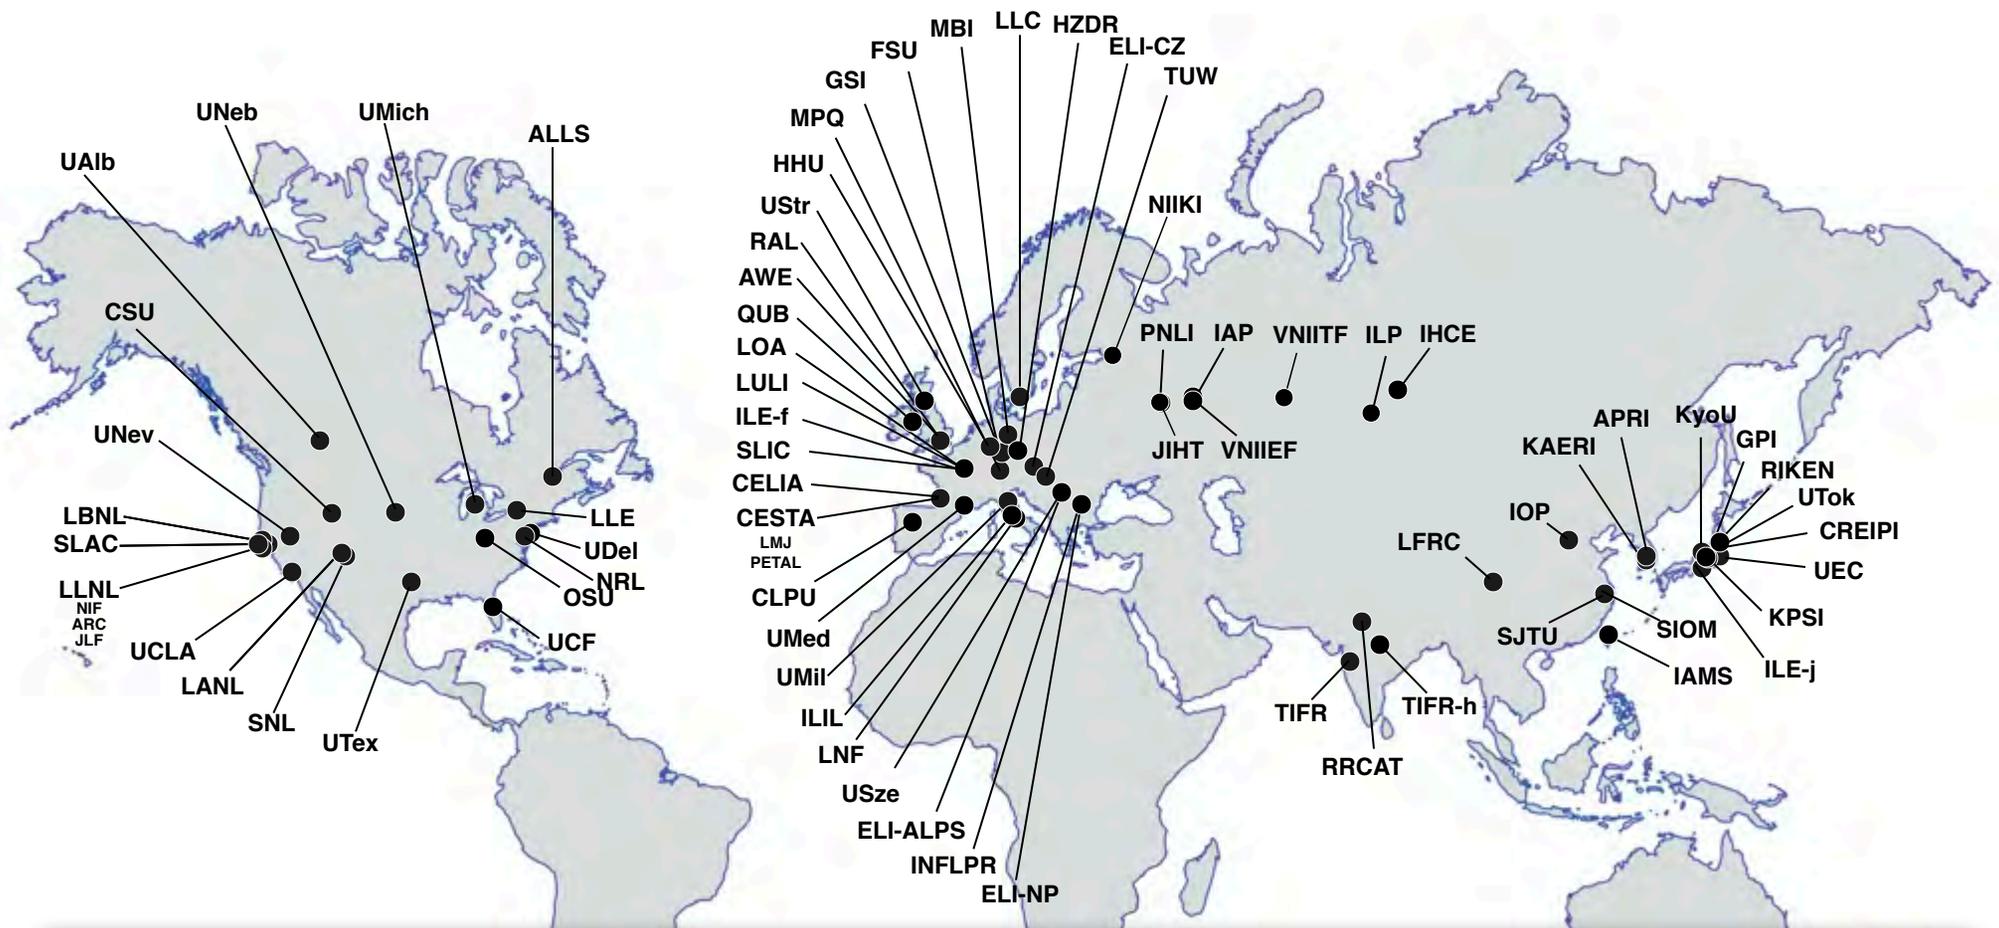

- The total peak power of all the intense systems operating in 2010 was ~11.5 PW

Present ICUIL World Map of Ultrahigh Intensity Laser Capabilities

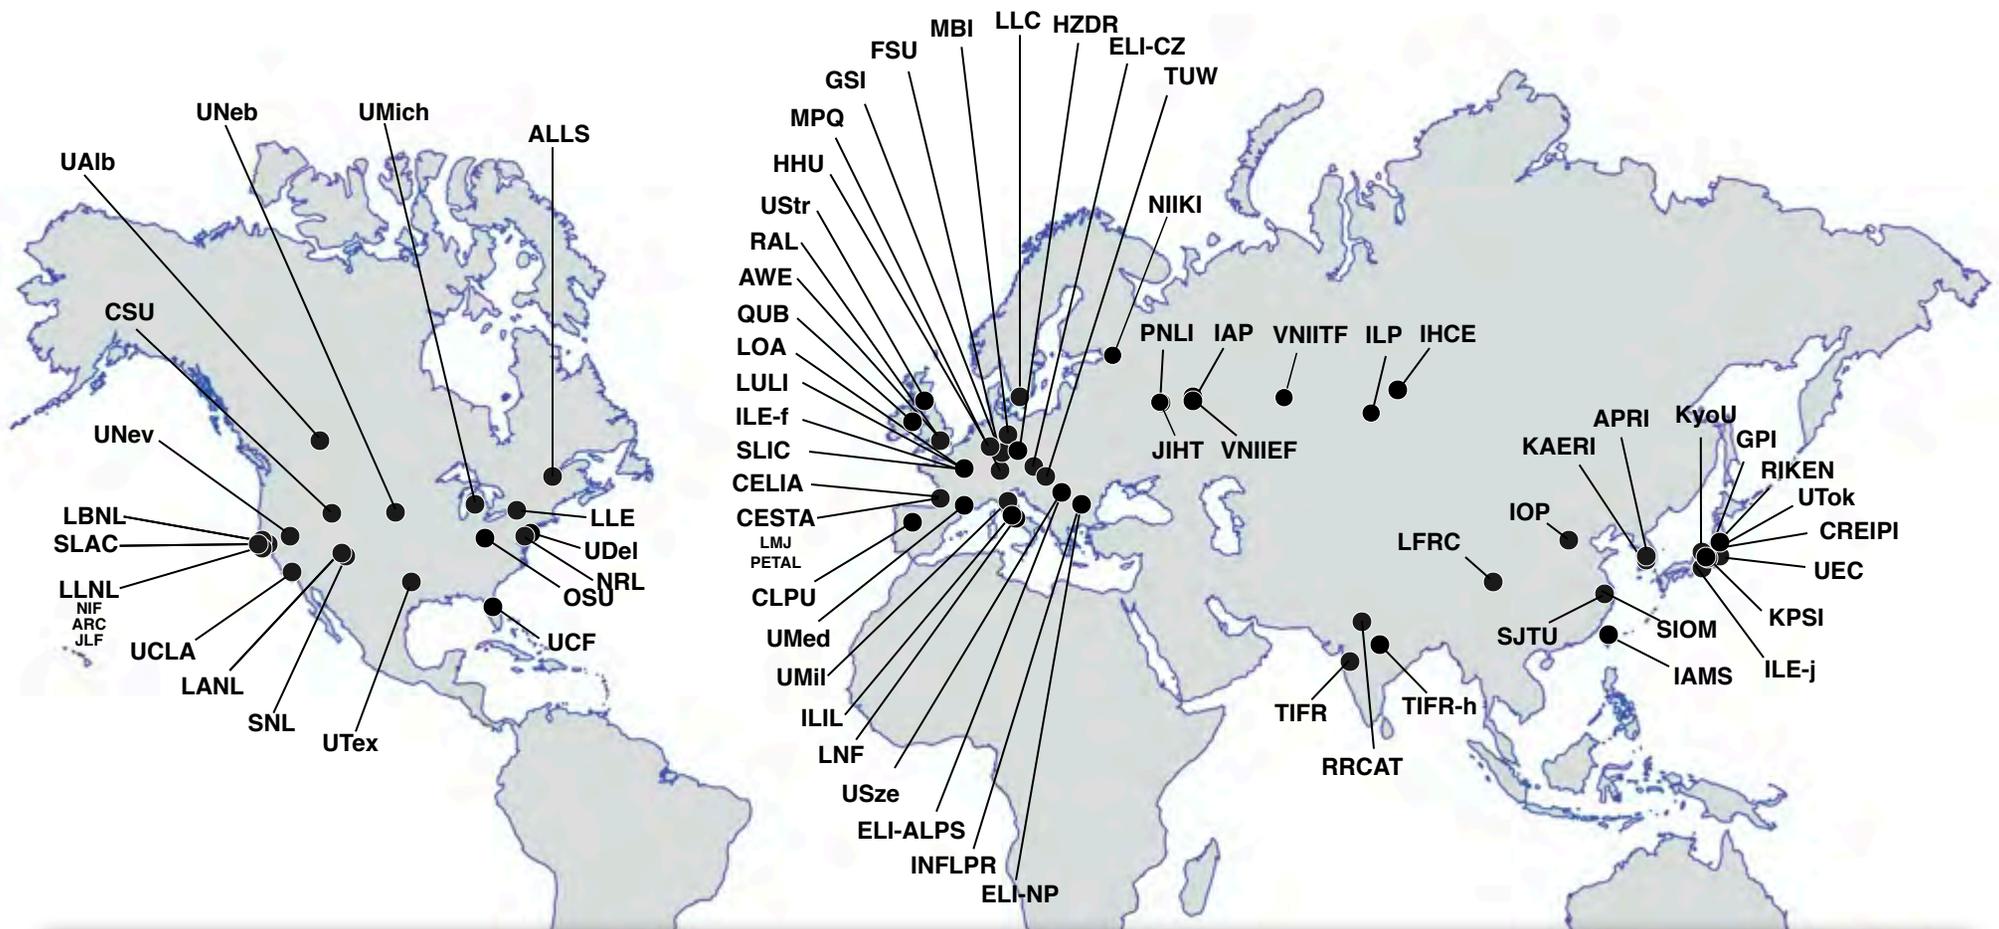

- The total peak power of all the intense systems operating in 2010 was ~11.5 PW
- By the end of 2017 planned intense laser projects will total to ~127 PWs

Present ICUIL World Map of Ultrahigh Intensity Laser Capabilities

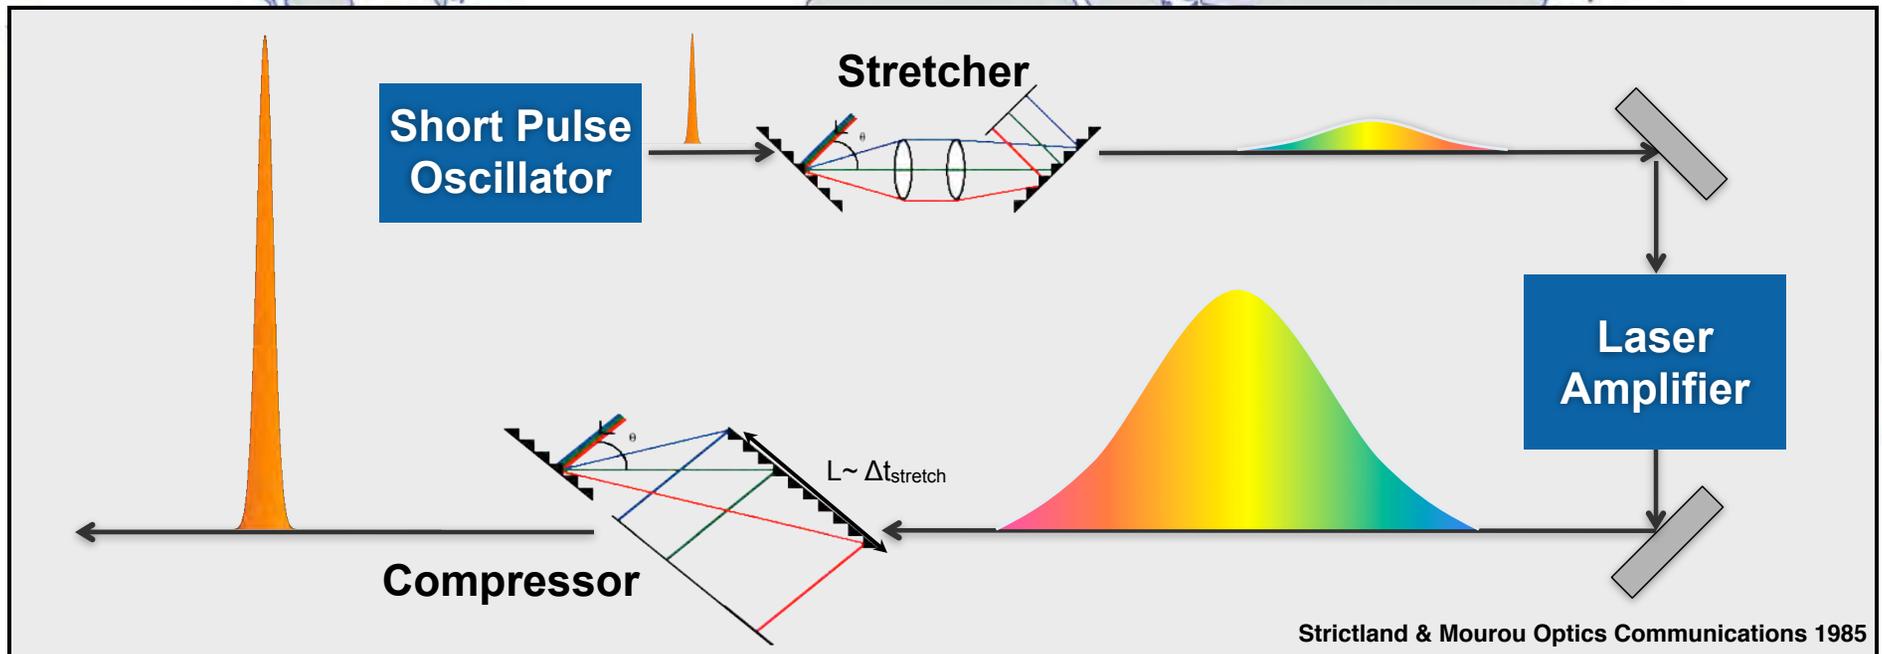

- The total peak power of all the intense systems operating in 2010 was ~11.5 PW
- By the end of 2017 planned intense laser projects will total to ~127 PWs
- These CPA projects represent ~\$4.3B of effort by ~1600 people

Present ICUIL World Map of Ultrahigh Intensity Laser Capabilities

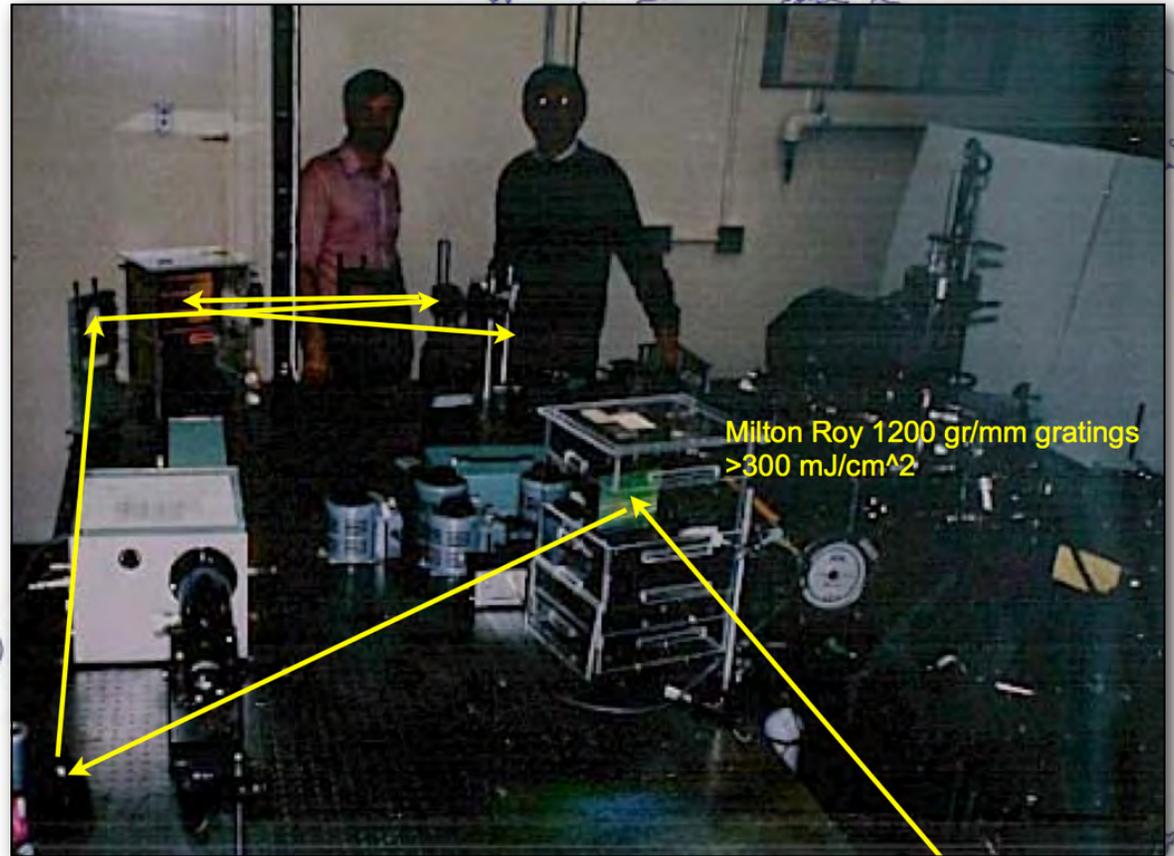

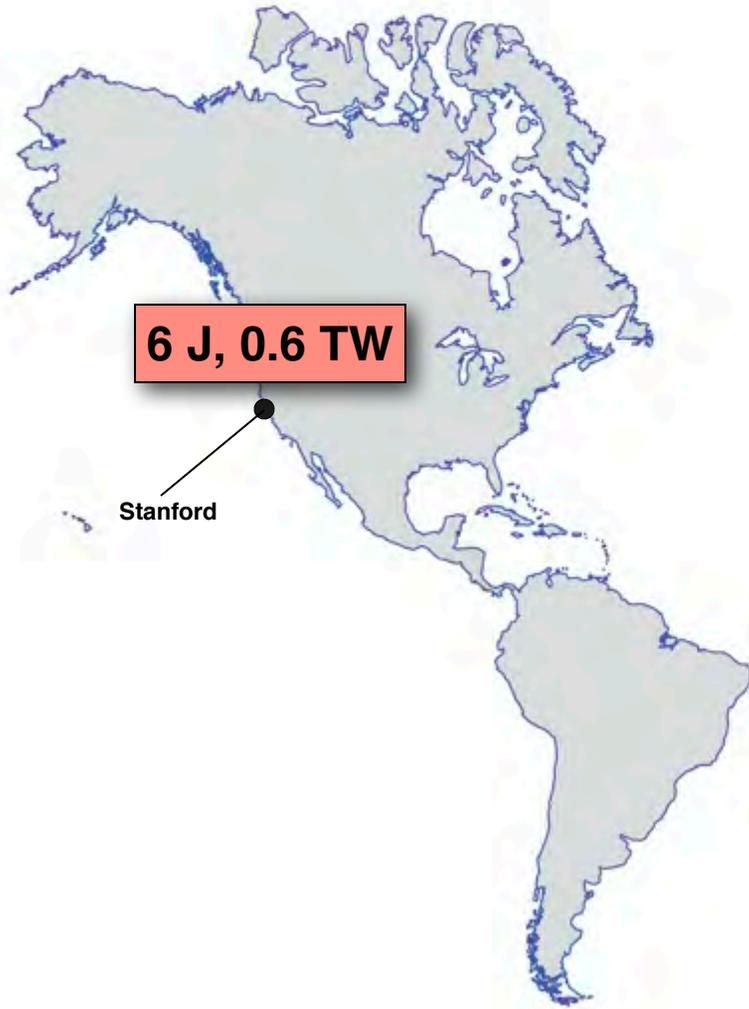

- The total peak power of all the intense systems operating in 2010 was ~11.5 PW
- By the end of 2017 planned intense laser projects will total to ~127 PWs
- These CPA projects represent ~\$4.3B of effort by ~1600 people
- These estimates did not include MJ systems or planned Exawatt-scale projects

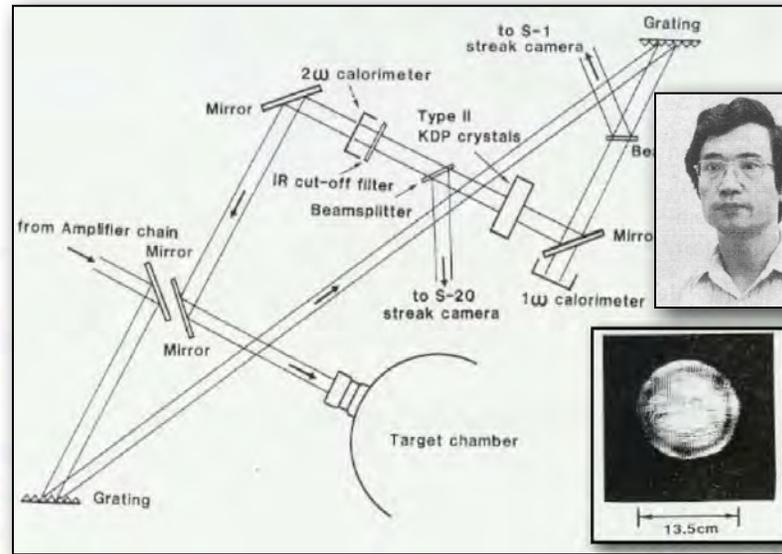

It started in 1985 with the invention of chirped pulse amplification

1987 - Stanford University

1989 - Institute for Laser Engineering @ Osaka University

30 J, 30 TW

ILE-j

1996 - Lawrence Livermore National Laboratory

600 J, > 1PW

LLNL

1996 - Lawrence Livermore National Laboratory

600 J, > 1PW

LLNL

1996 - Lawrence Livermore National Laboratory

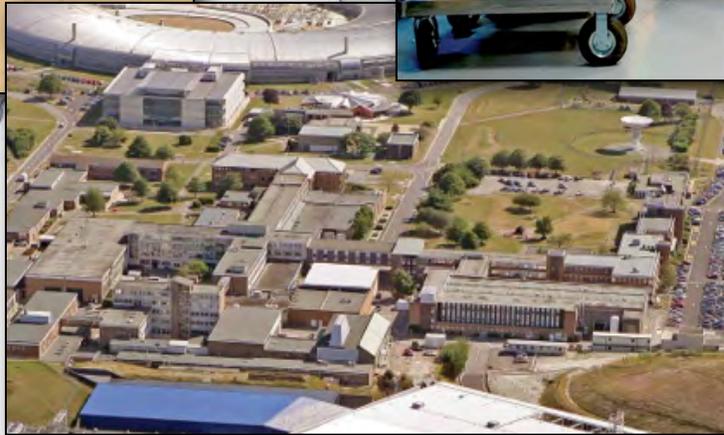

600 J, > 1PW

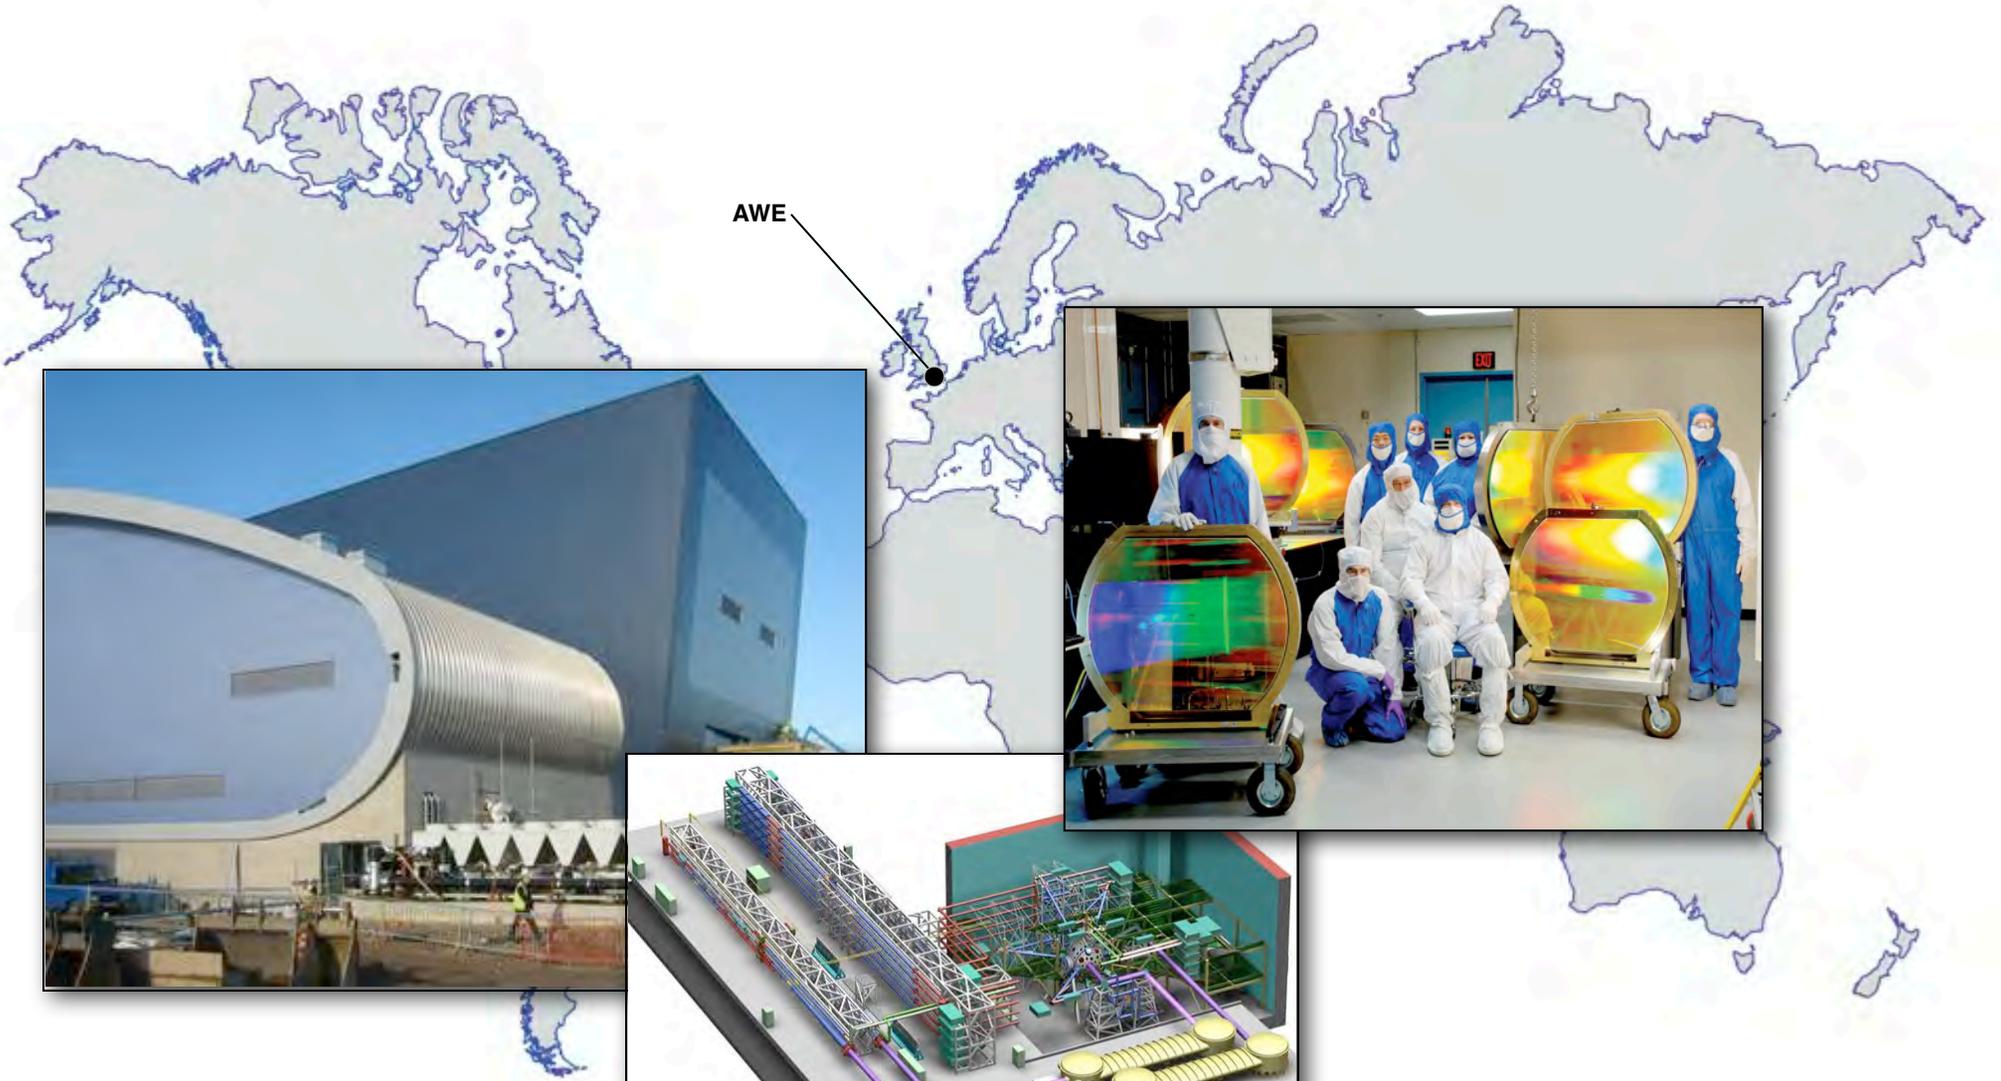

LLNL

Today - Rutherford Appleton Laboratory

Today - Atomic Weapons Establishment

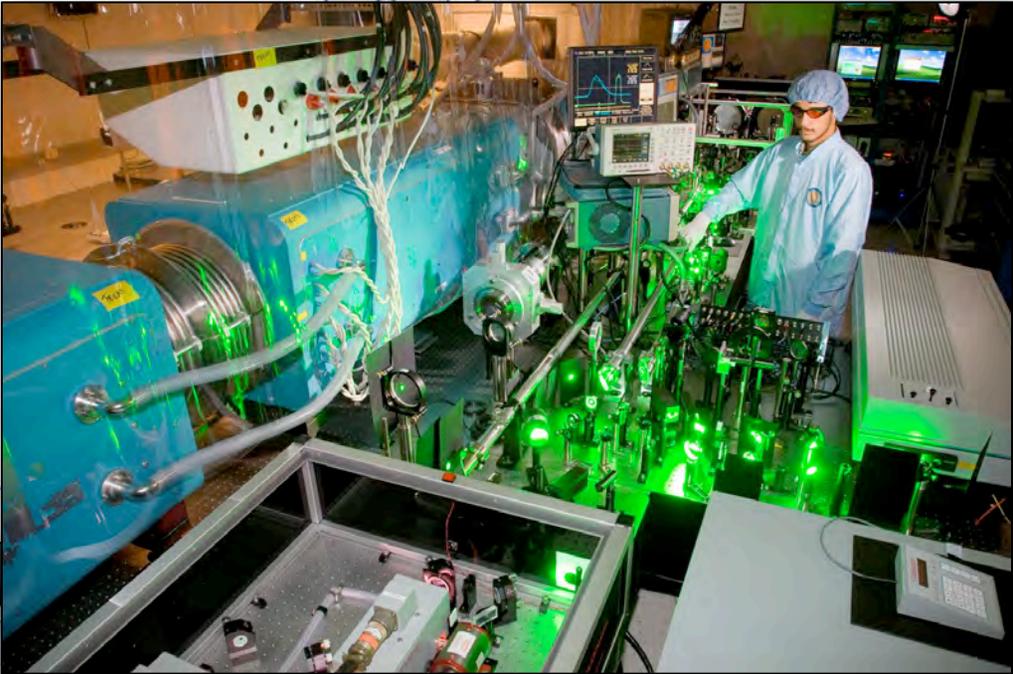

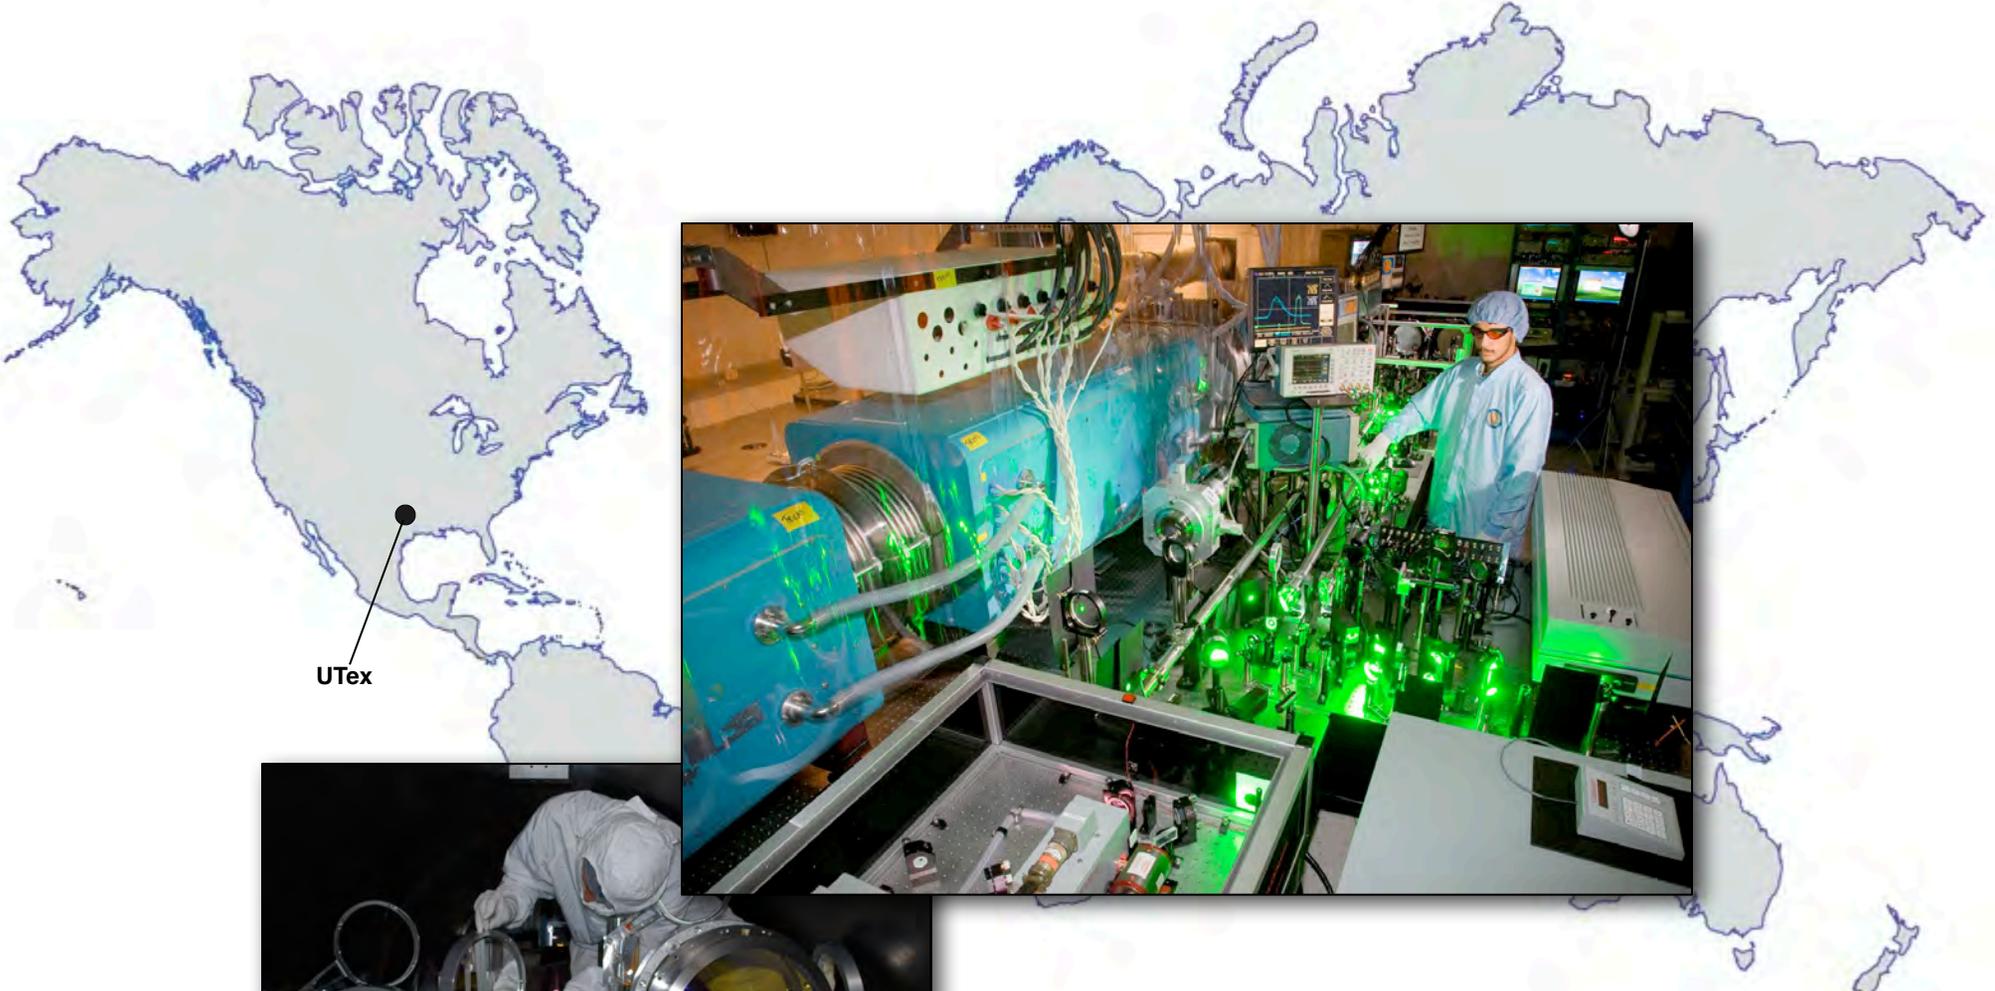

Today - GSI Germany

GSI

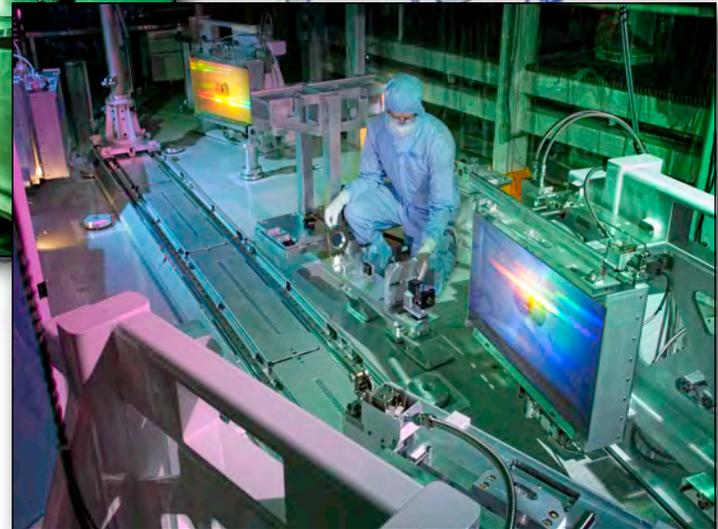

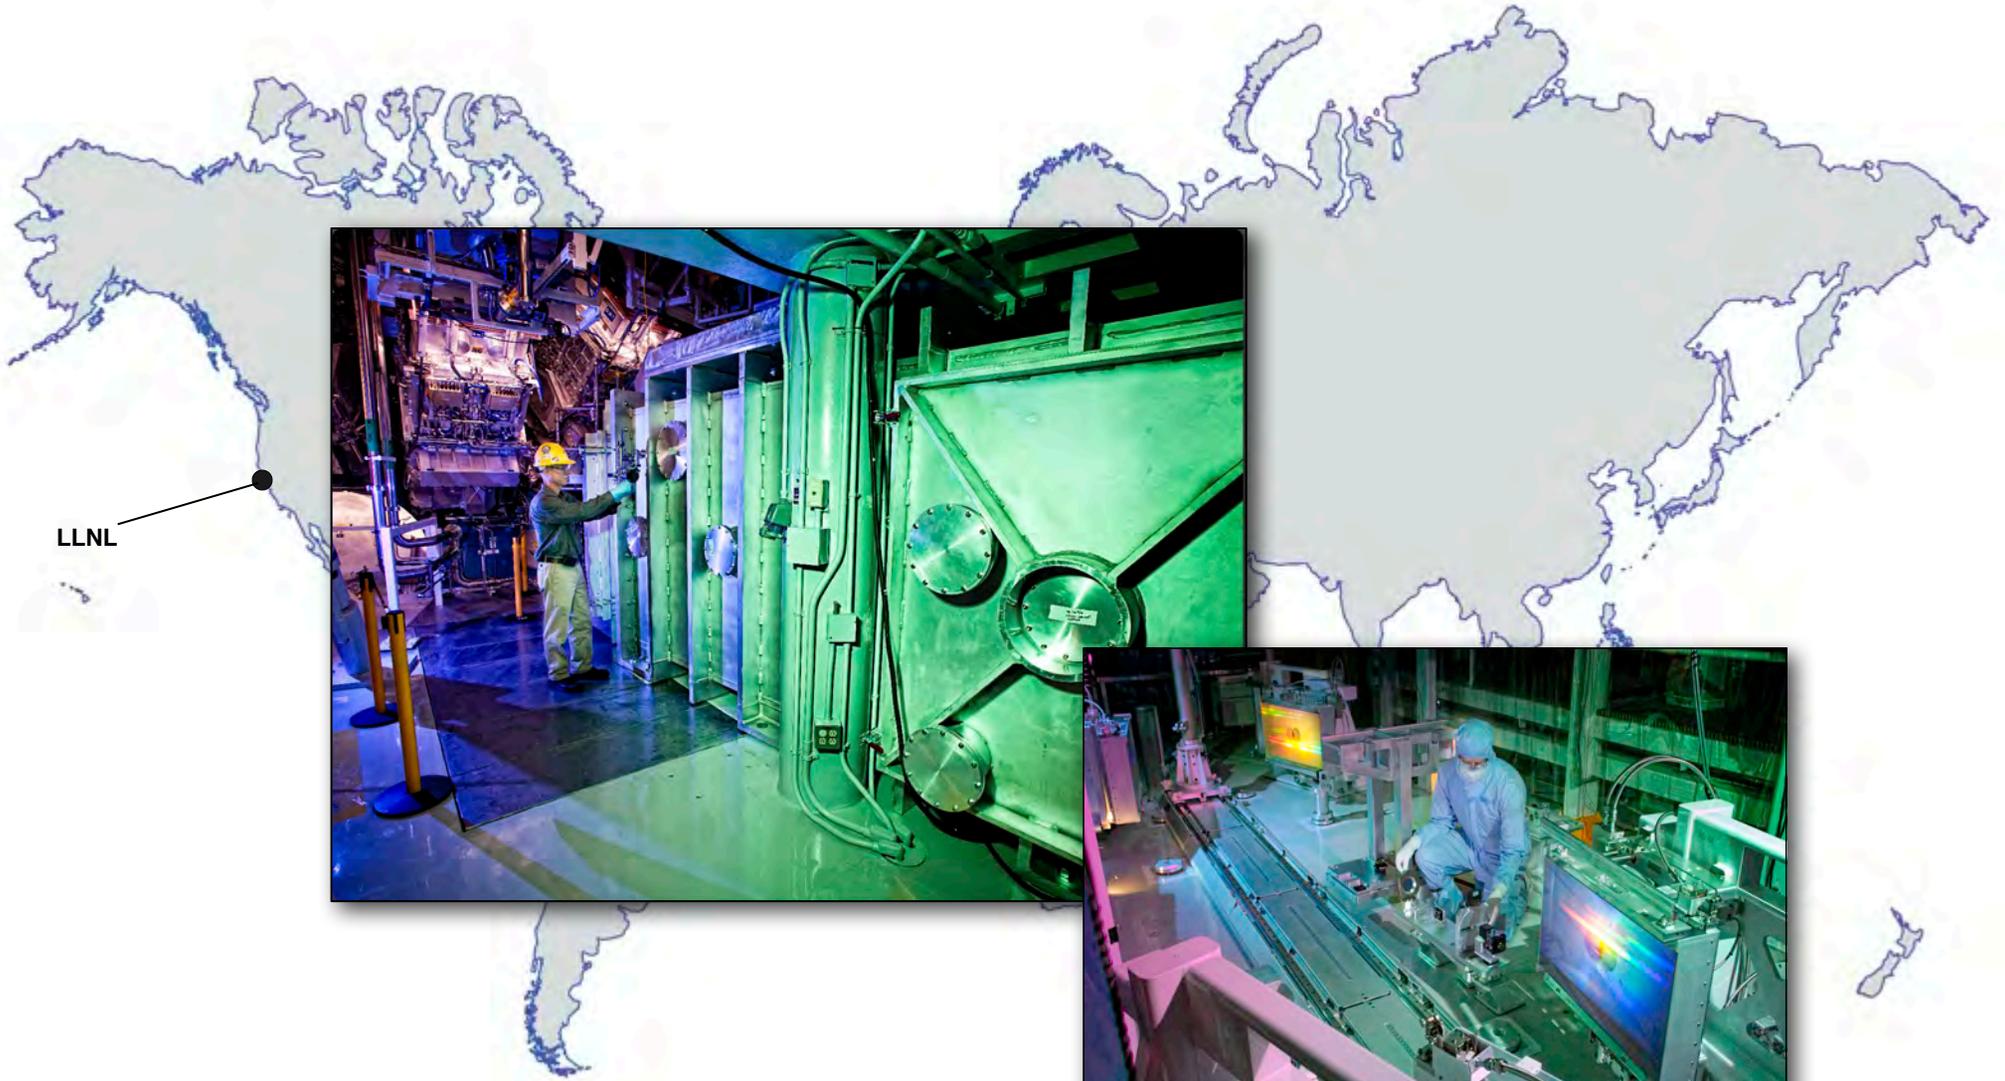

Today - UT Austin Texas PW

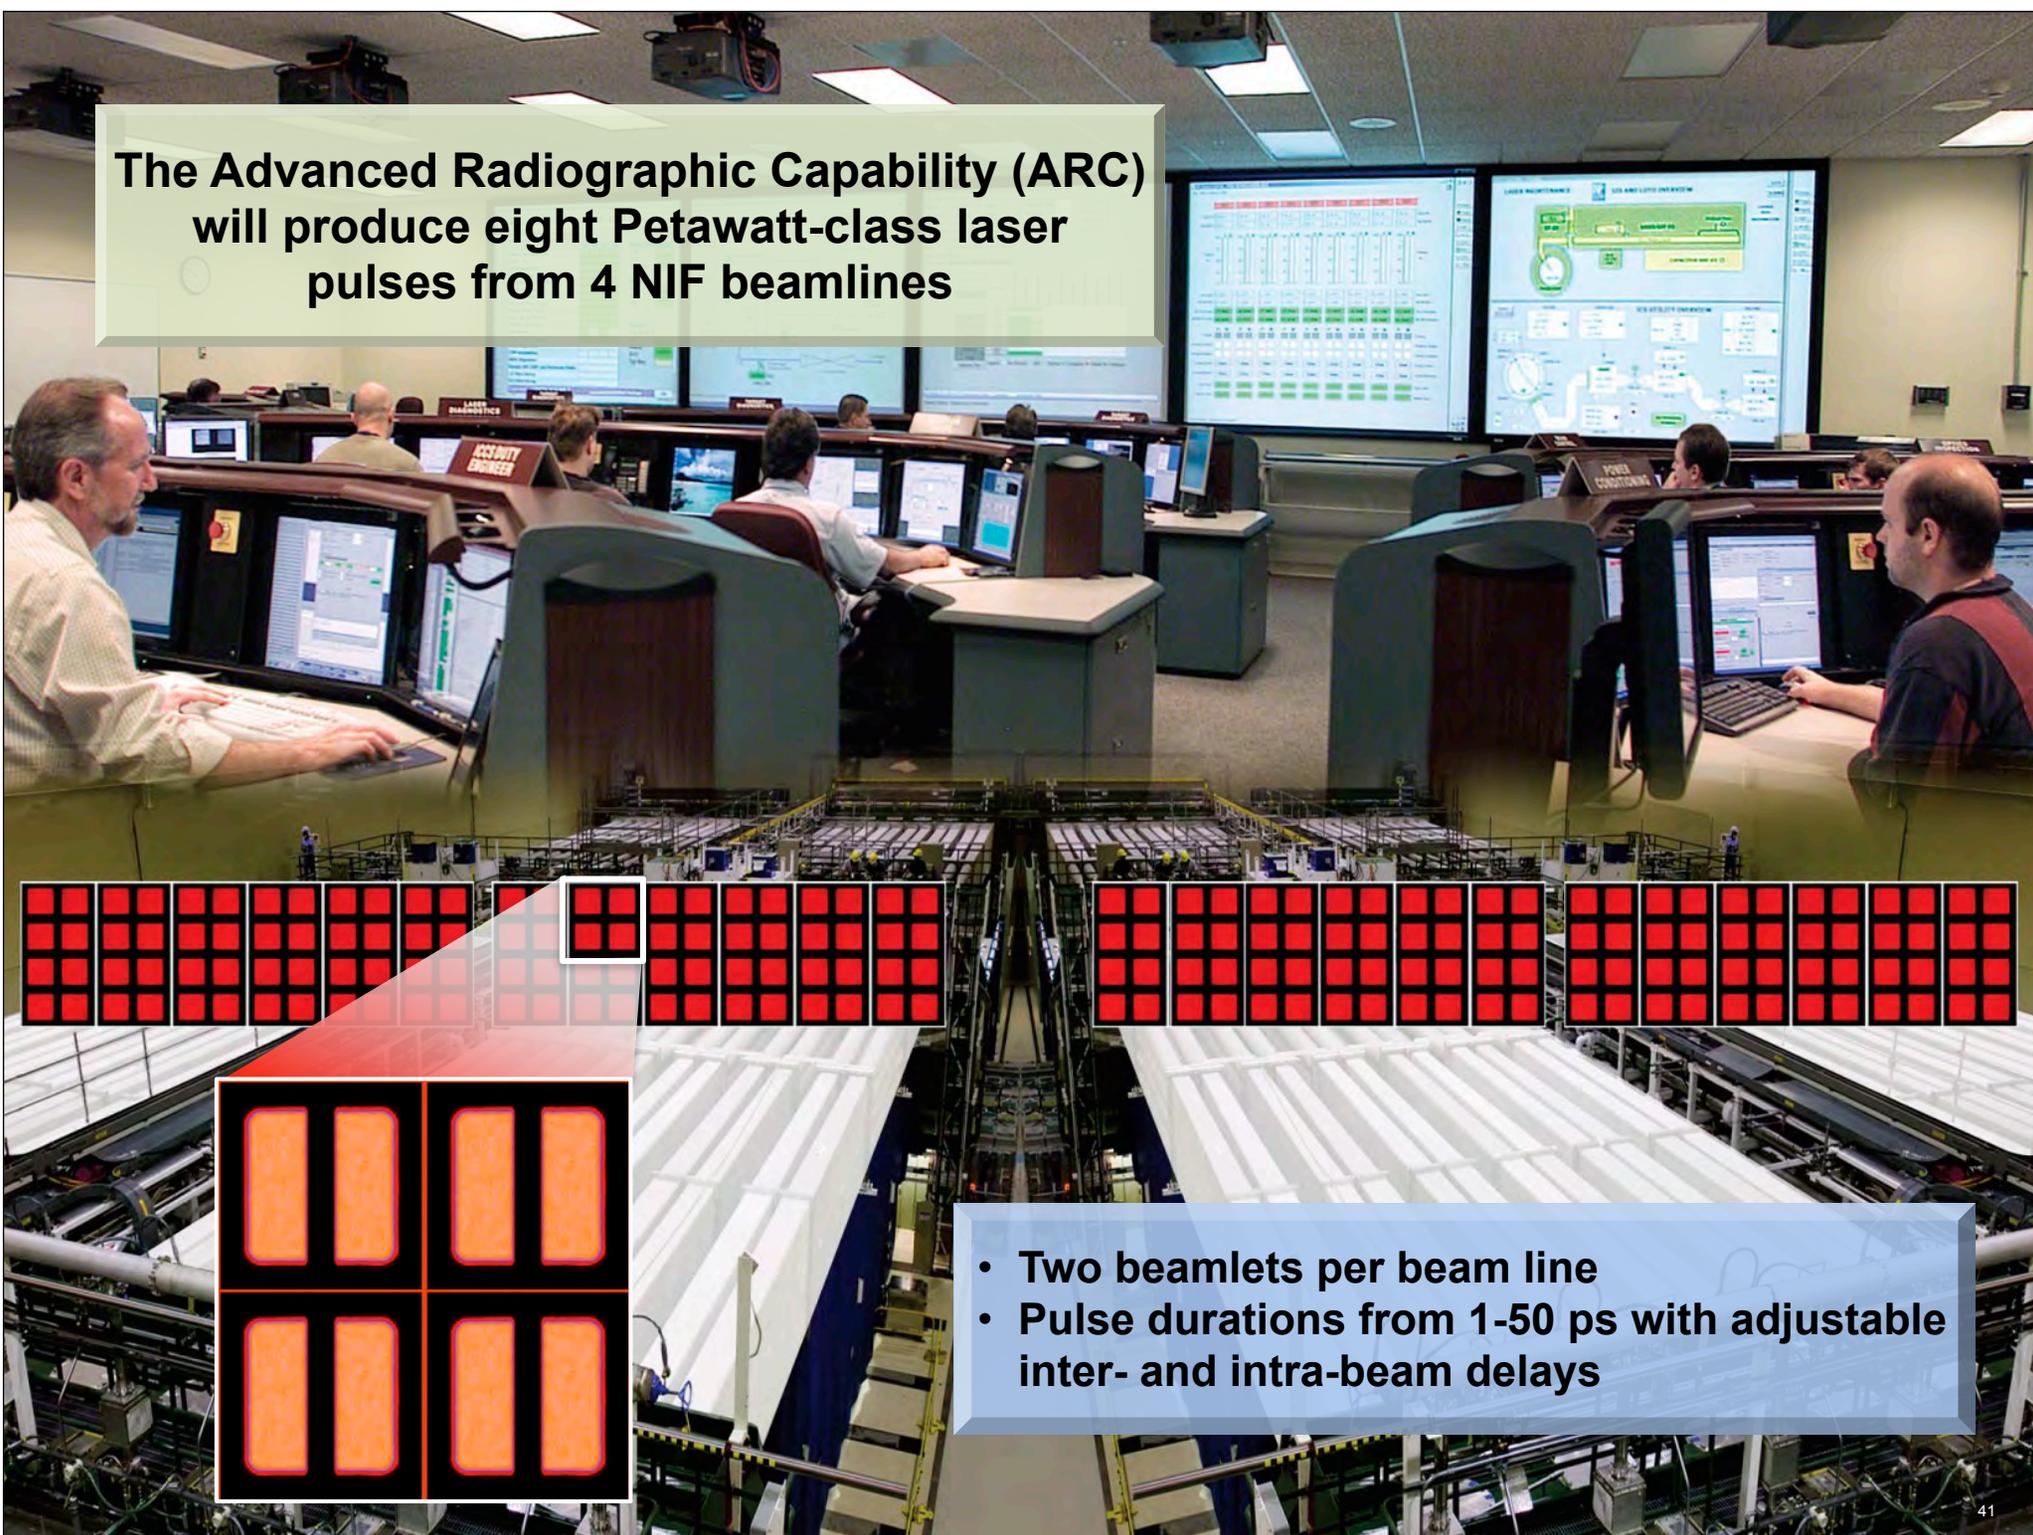

Today - Omega EP at LLE

Tomorrow - "ARC" 10 kJ in 10 ps at the NIF

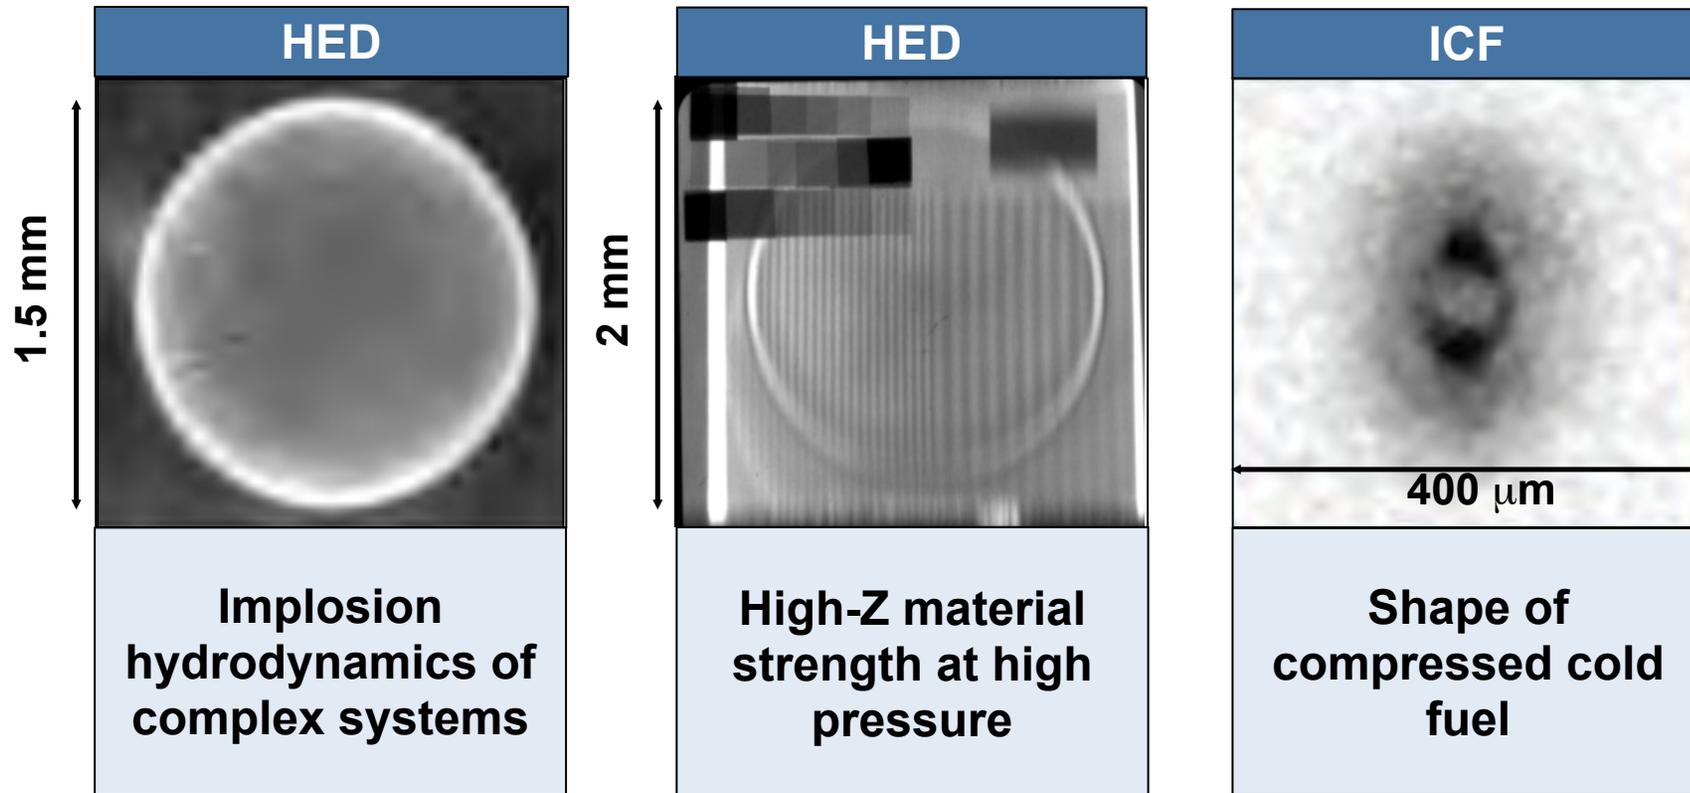

The Advanced Radiographic Capability (ARC) will produce eight Petawatt-class laser pulses from 4 NIF beamlines

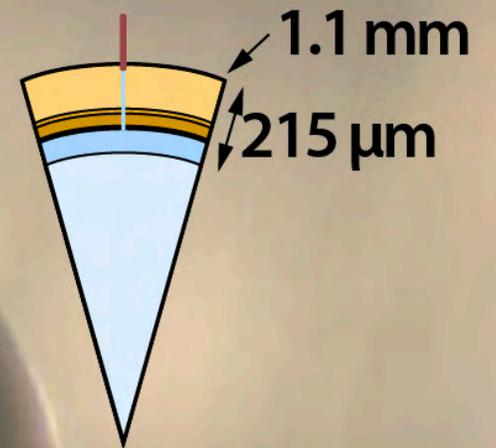

- Two beamlets per beam line
- Pulse durations from 1-50 ps with adjustable inter- and intra-beam delays

ARC high energy backlighting capability is required for the high energy density science & ICF programs

Planned NIF experiments will use ARC to produce back lighters at energies up to 100 keV

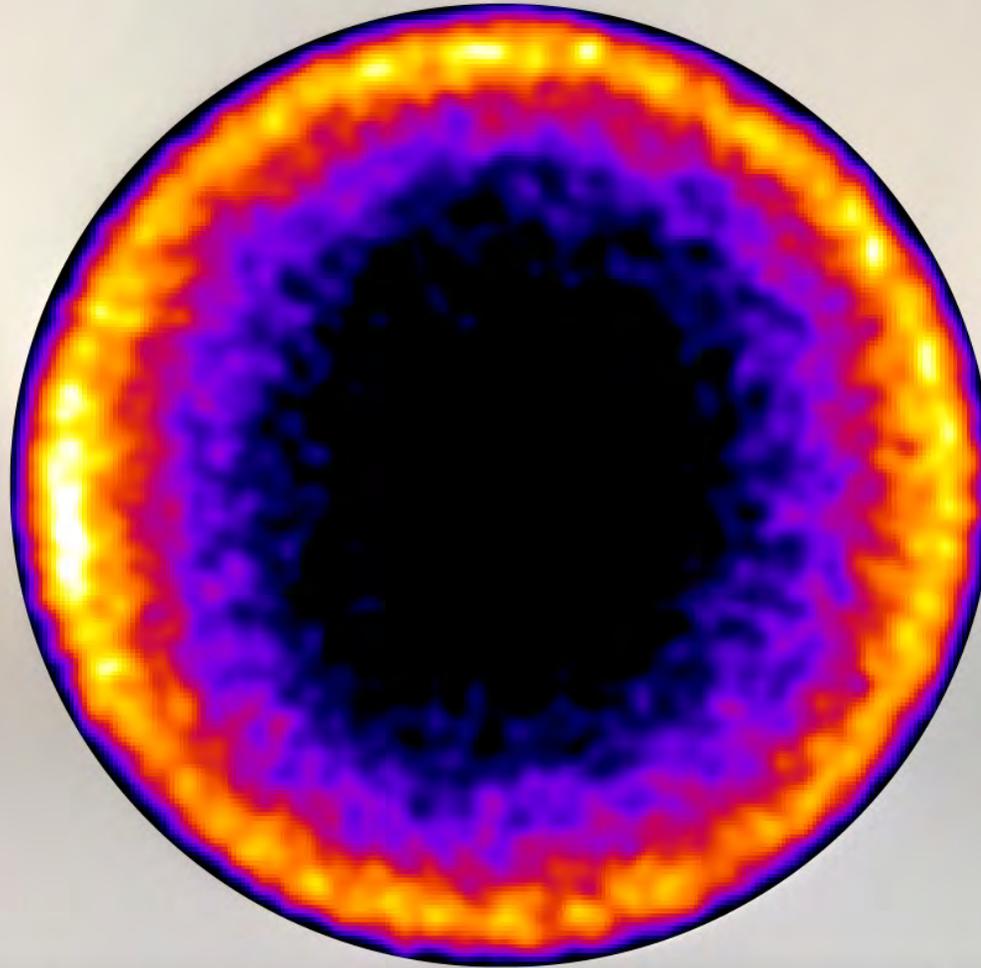

The capsule starts at 2mm diameter

← ~ 2 mm diameter →

Re-emission sphere measures early time
x-drive symmetry

Bang time – 19 ns

1 billionth of a second into the laser pulse

Radiography measures the shape of the capsule in-flight

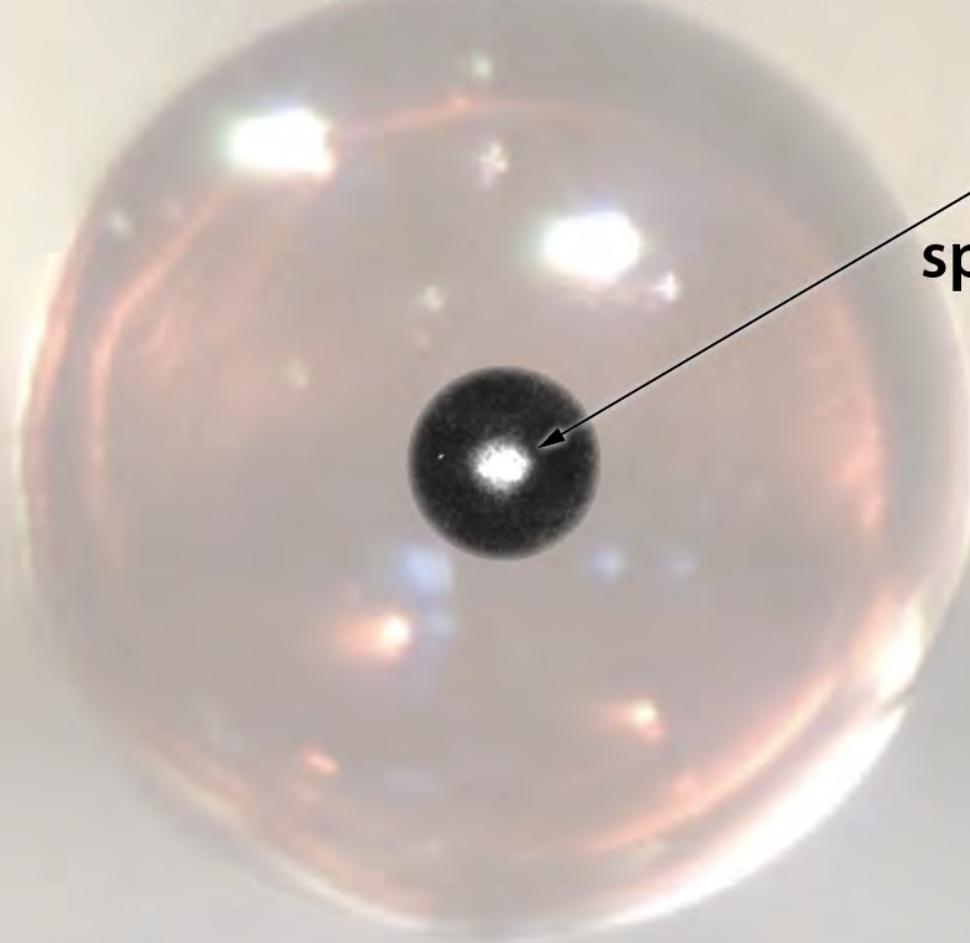

N121004
Bang time – 600 ps

← ~ 2 mm diameter →

Radiography measures the shape of the capsule in-flight

N121004
Bang time – 300 ps

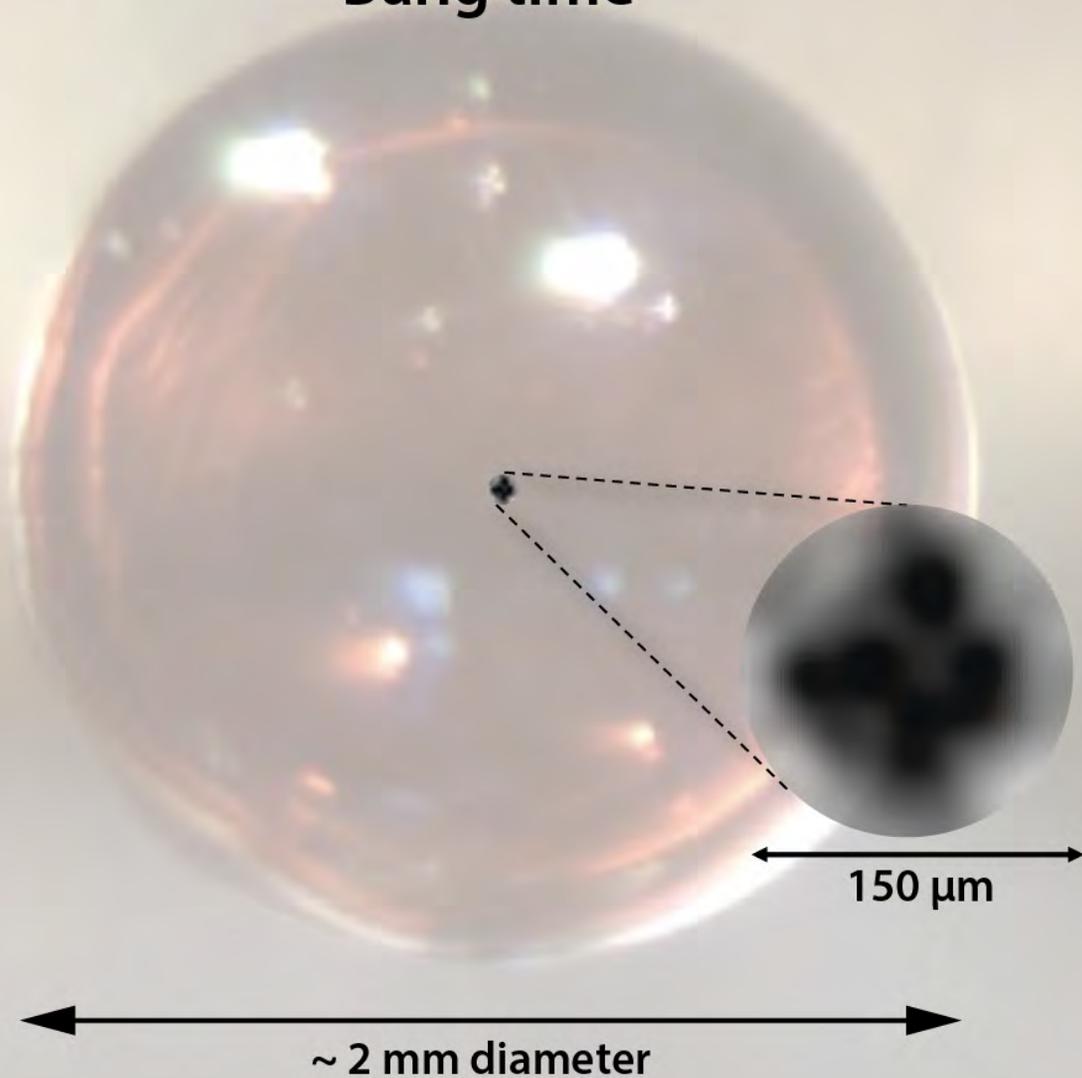

Early hot
spot formation

~ 2 mm diameter

Compton radiography probes fuel shape at stagnation

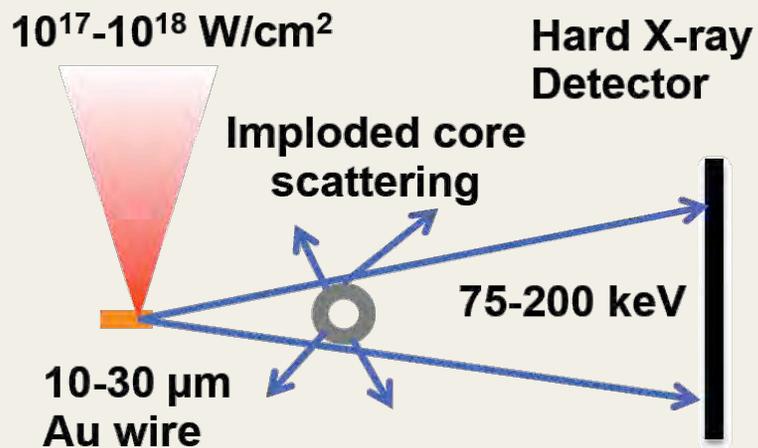

N121005
Bang time

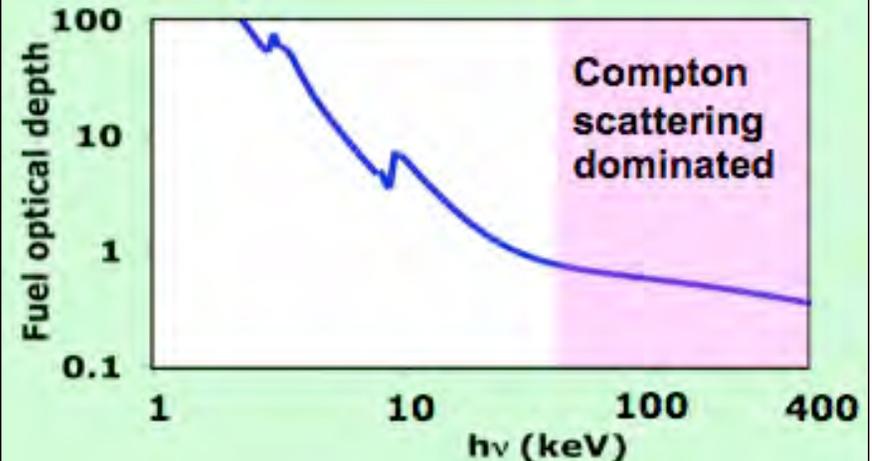

Point projection high energy (>75keV) radiography is ideally suited to probe fuel shape and uniformity

Transmission Compton Radiography

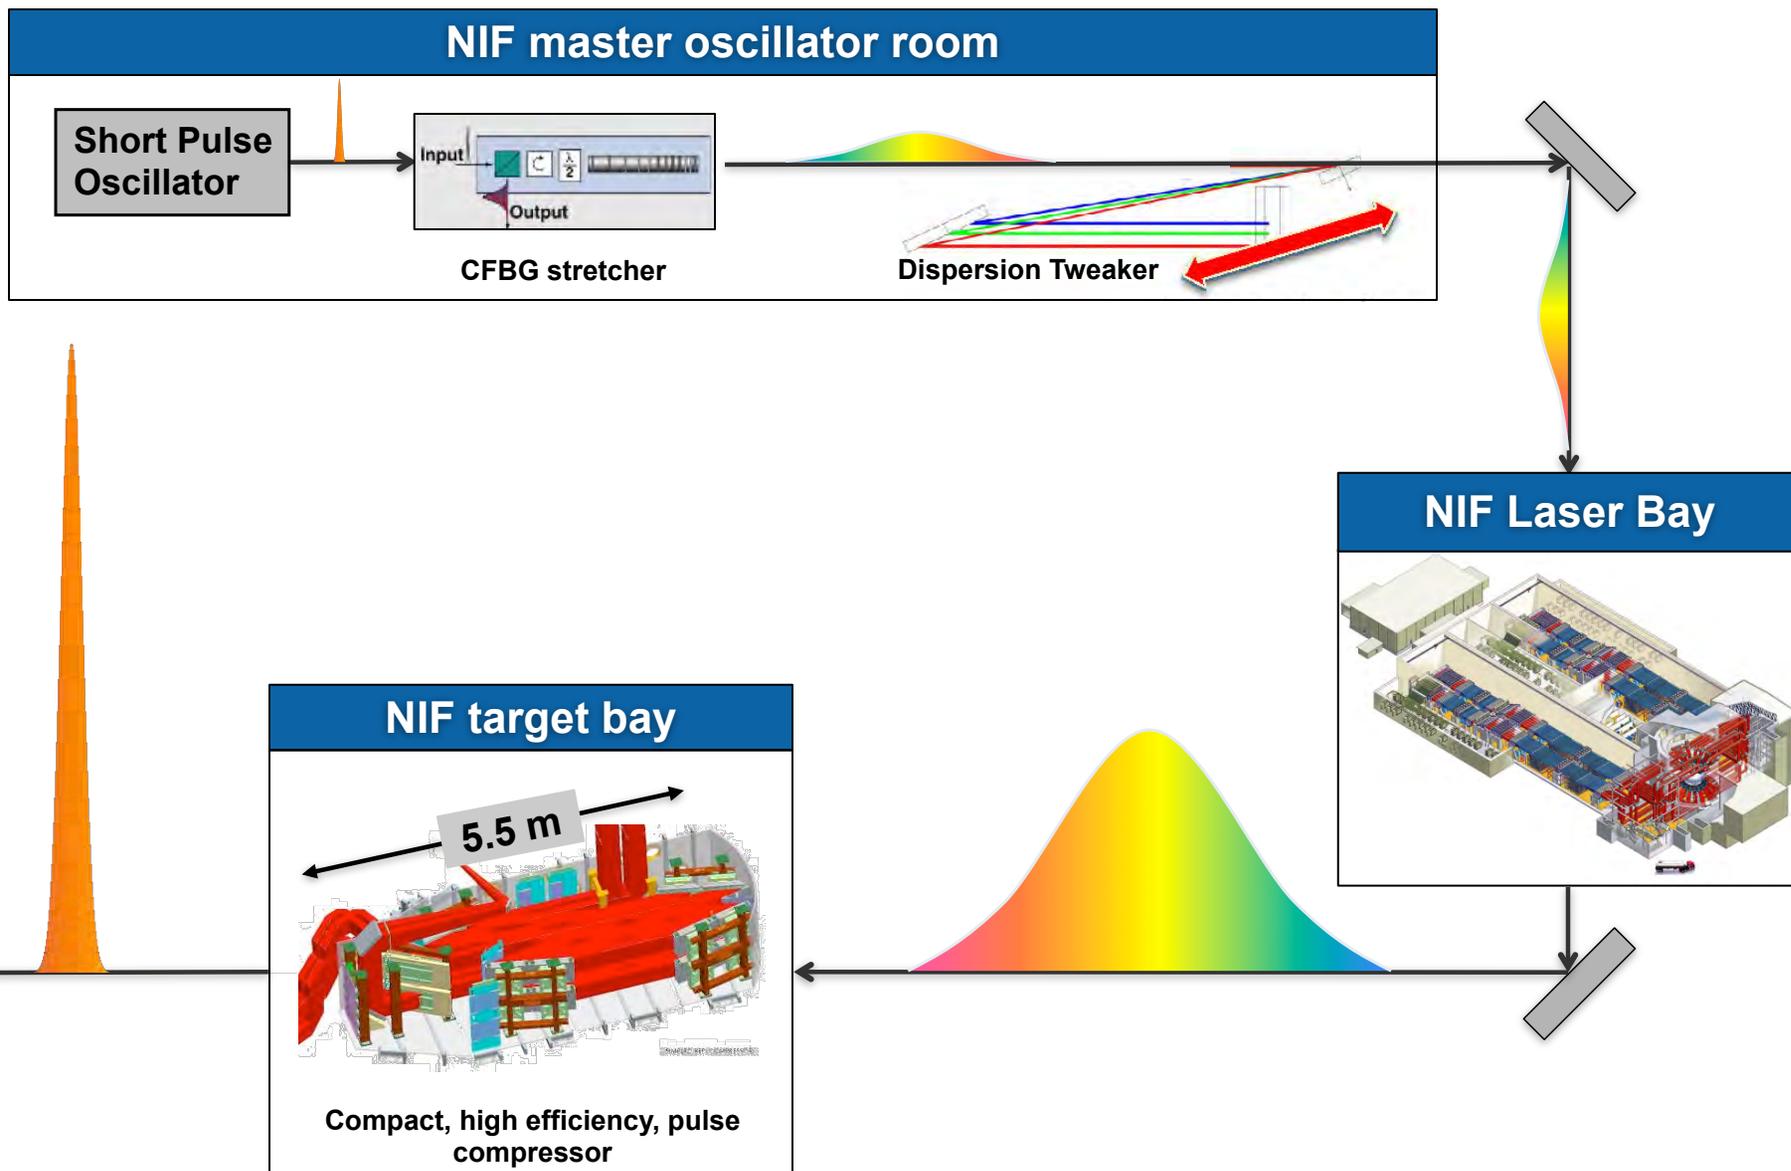

Optical depth of the fuel and ablator

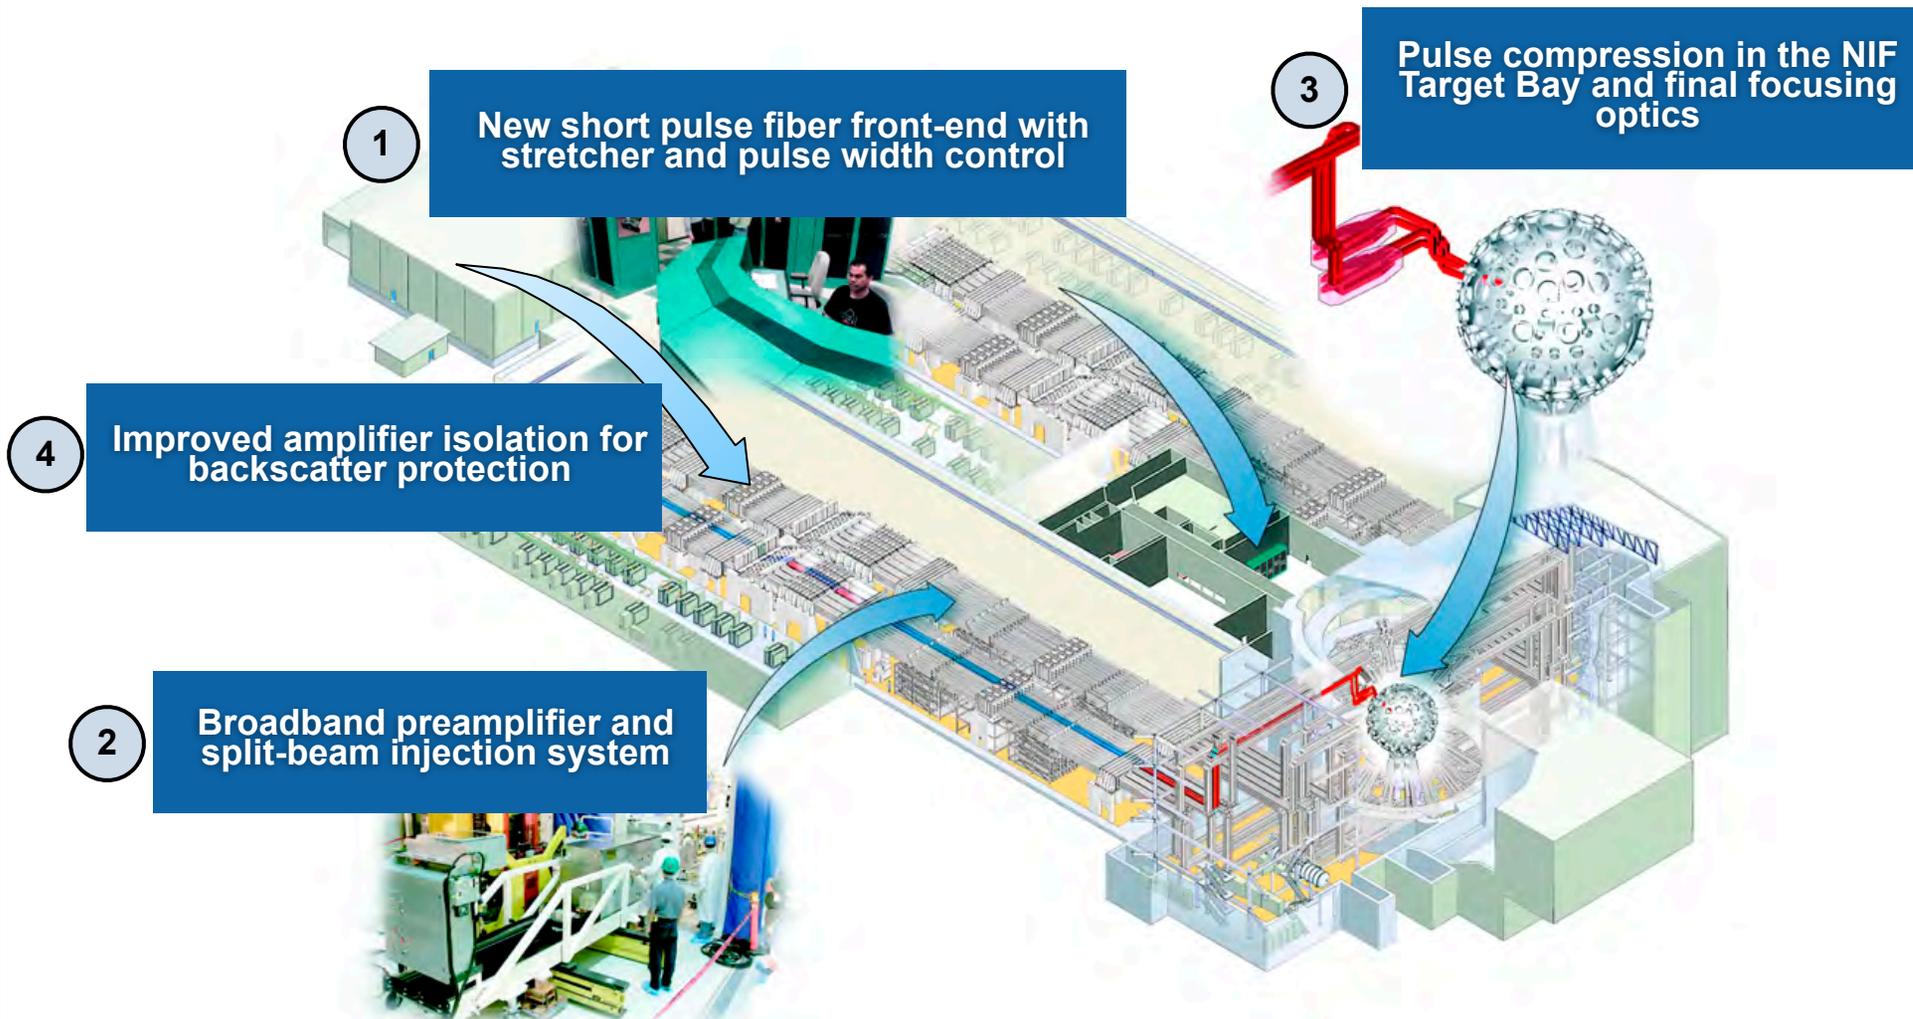

- Compton radiography is sensitive to n_e (not Z): ideal for probing DT fuel shape and density uniformity inside ablator
- Allows broadband operation as Compton cross section that dominates at high energy is weakly dependent on photon energy
- Radiography source is independently timed, in contrast to burn products
- Would require up to 60 long pulse beam lines to do the same job!

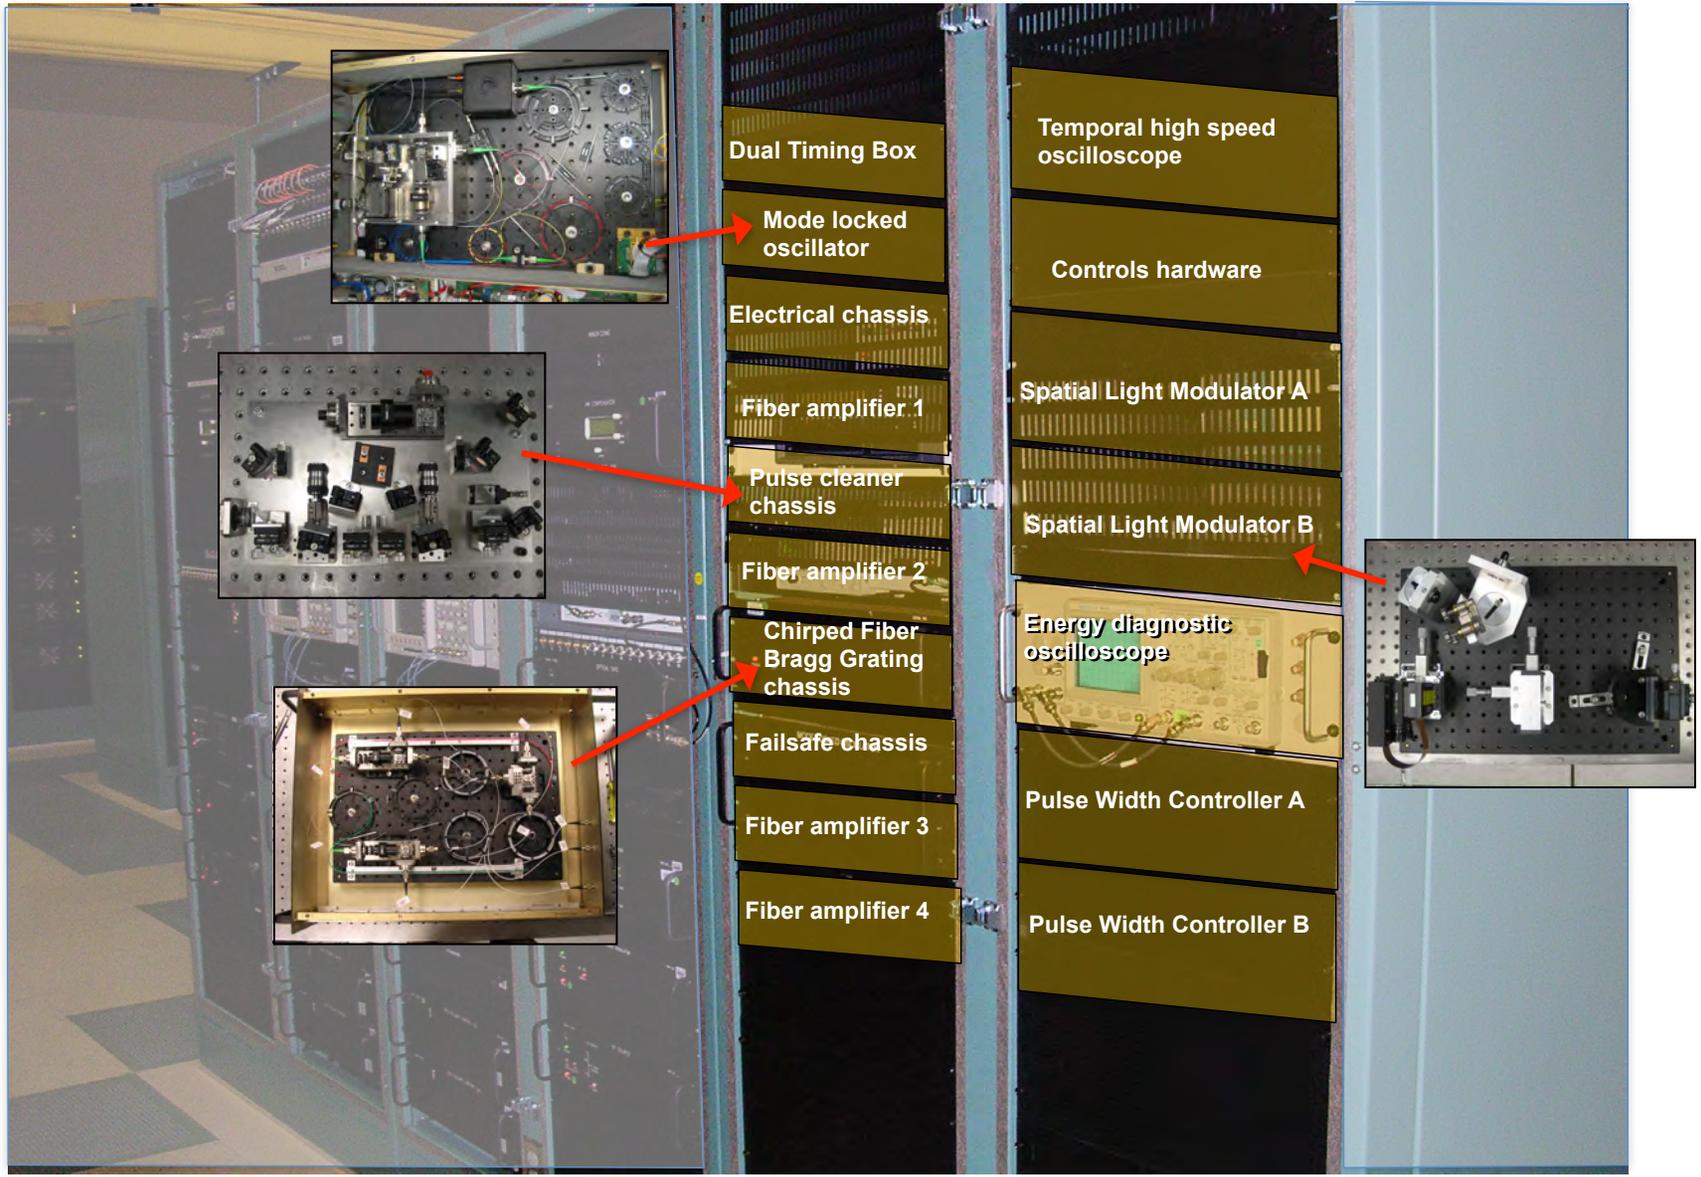

Each ARC beamlet uses chirped-pulse amplification to produce ps-timescale, laser pulses w/ > kJ energy

Conversion of NIF beam lines to high-intensity, picosecond operation requires 4 top level changes

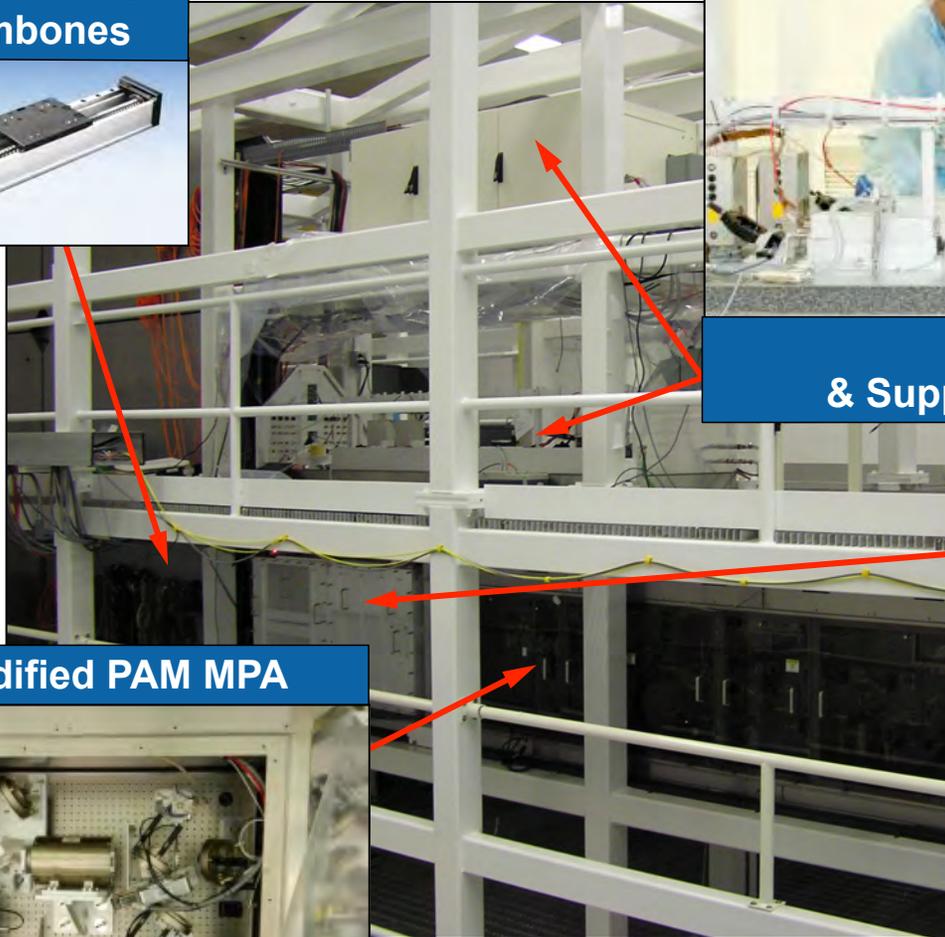

ARC requires a new master oscillator to propagate wide bandwidth pulses through NIF

ARC injection laser hardware amplifies and injects the master osc. room pulse into the NIF main laser

2.6 m PABTS Trombones

Dual Regen Table & Supporting Electronics Rack

ARC Split-Beam Injection System

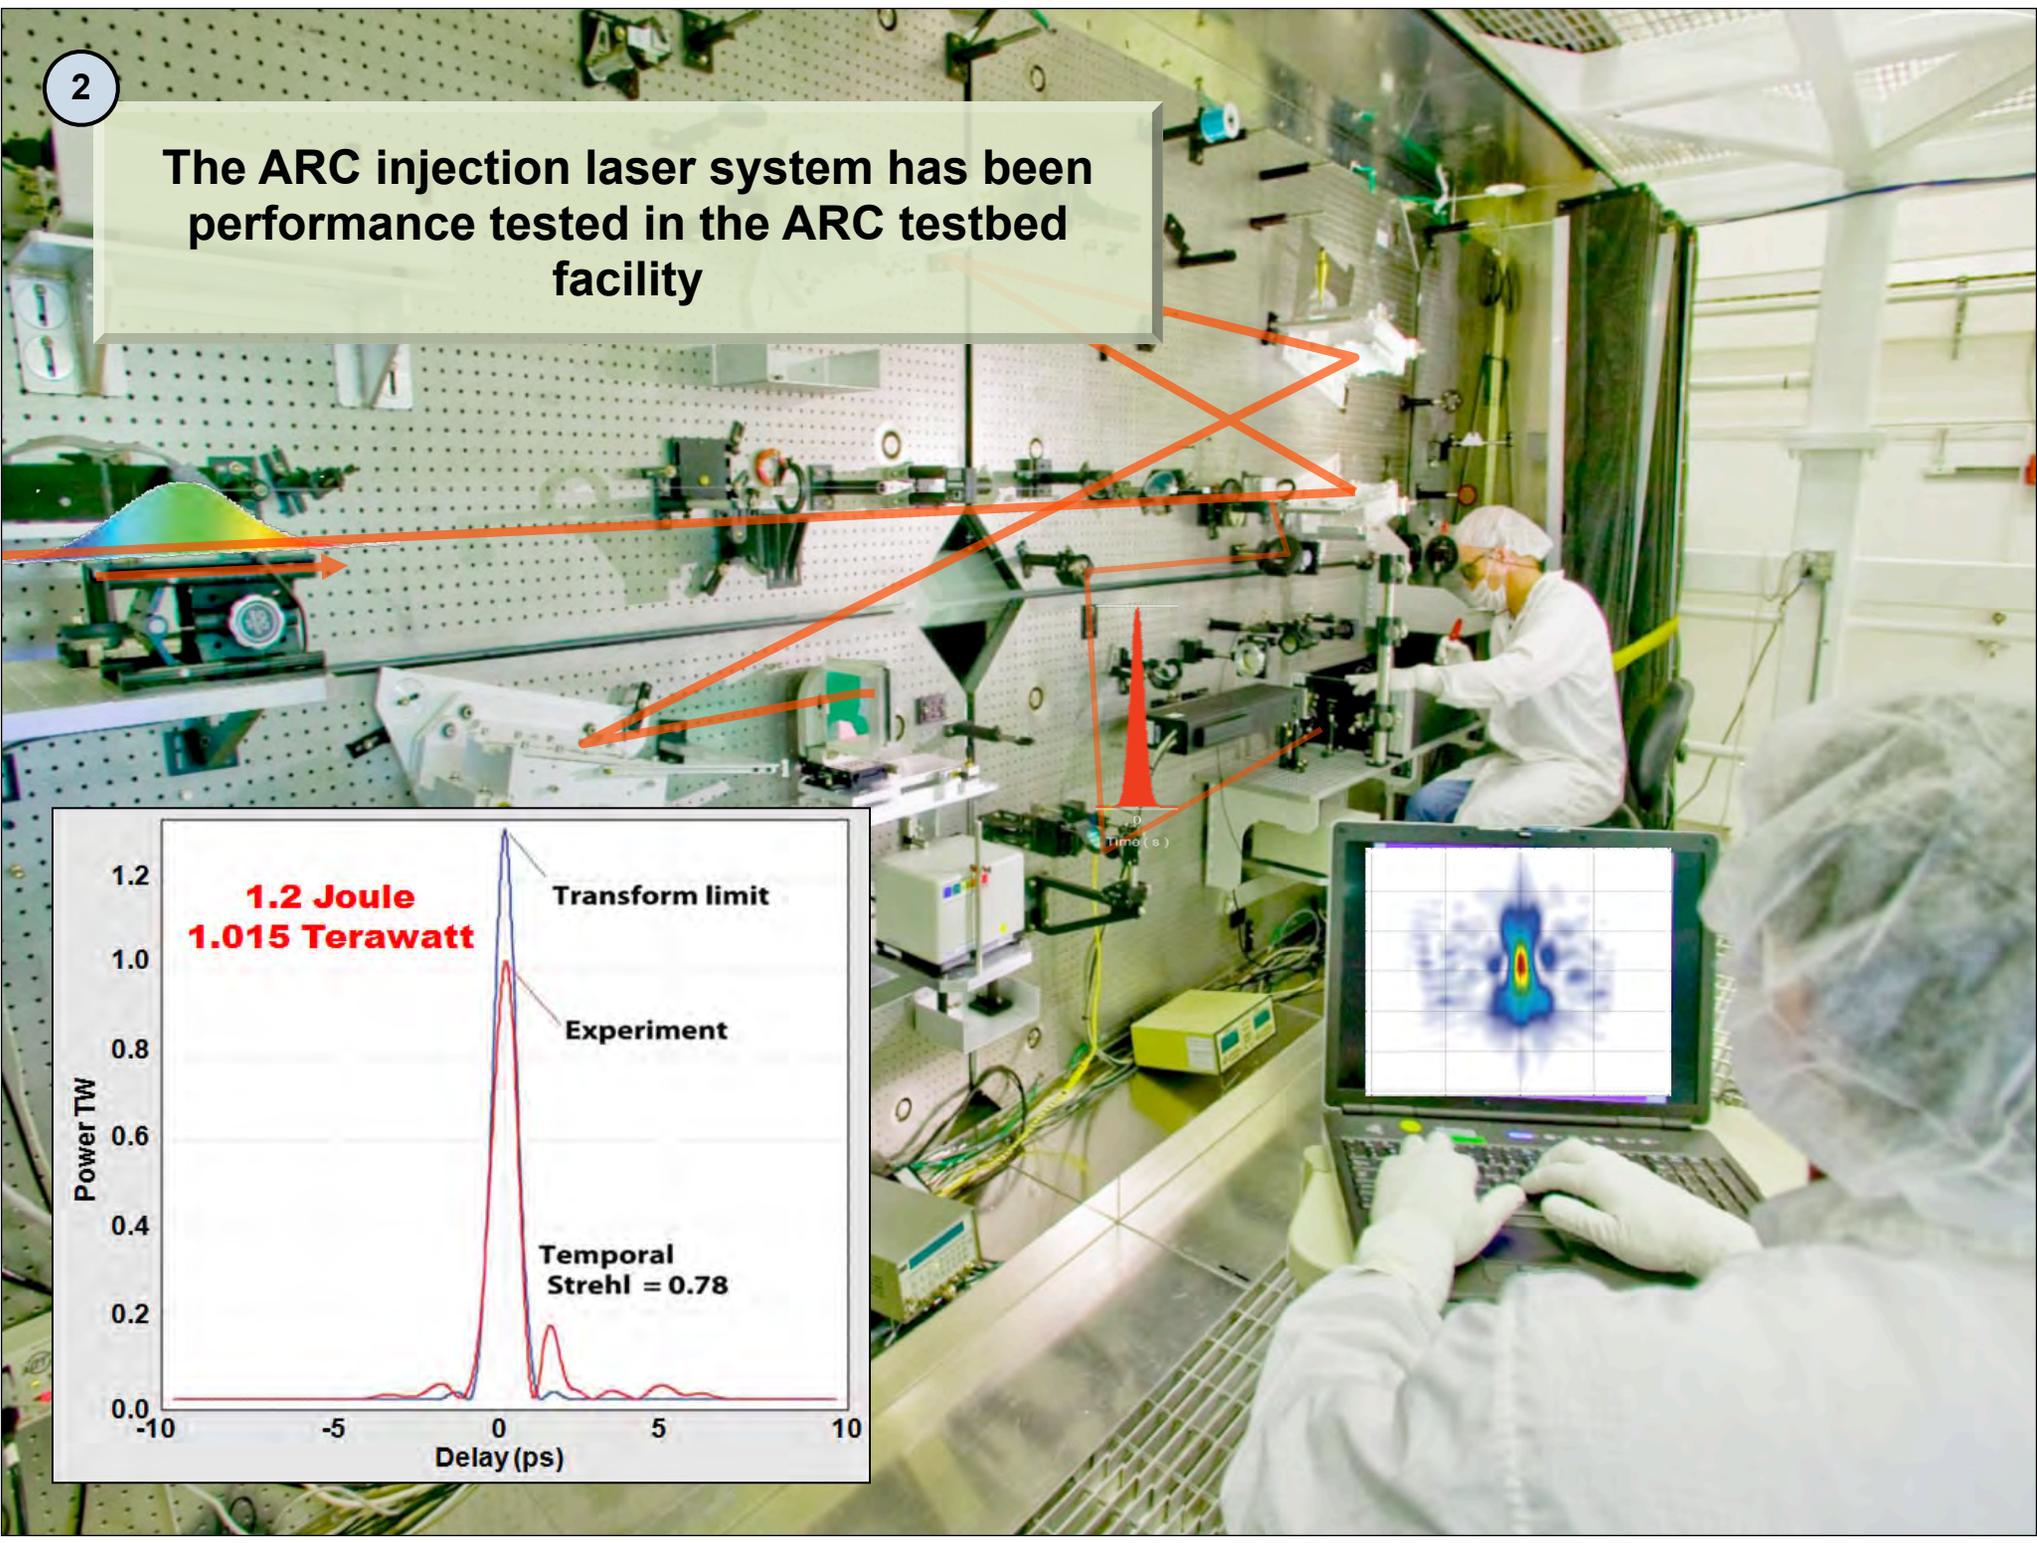

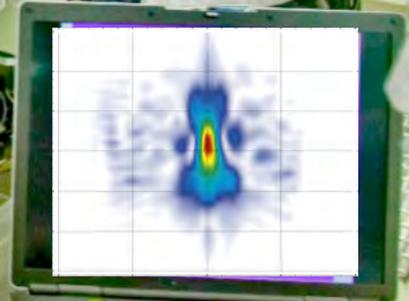

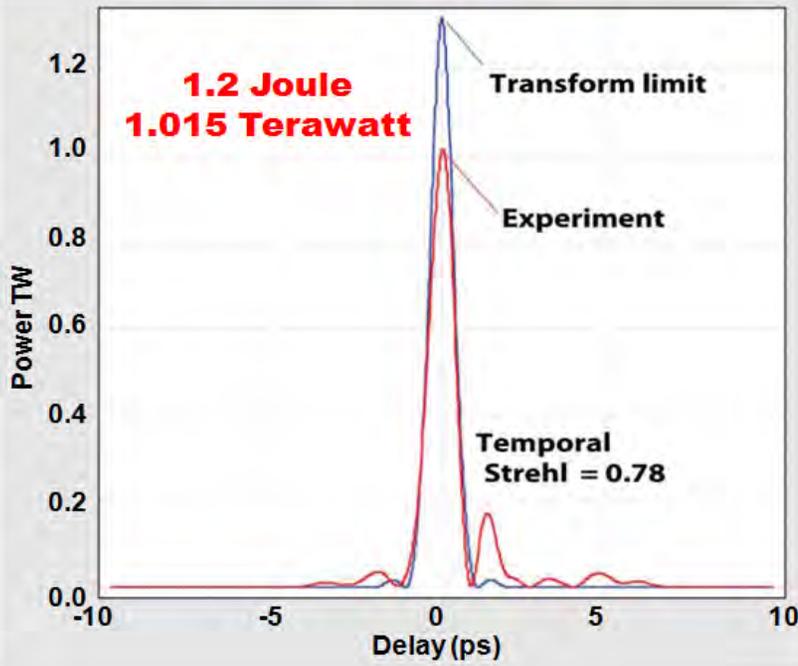

Modified PAM MPA

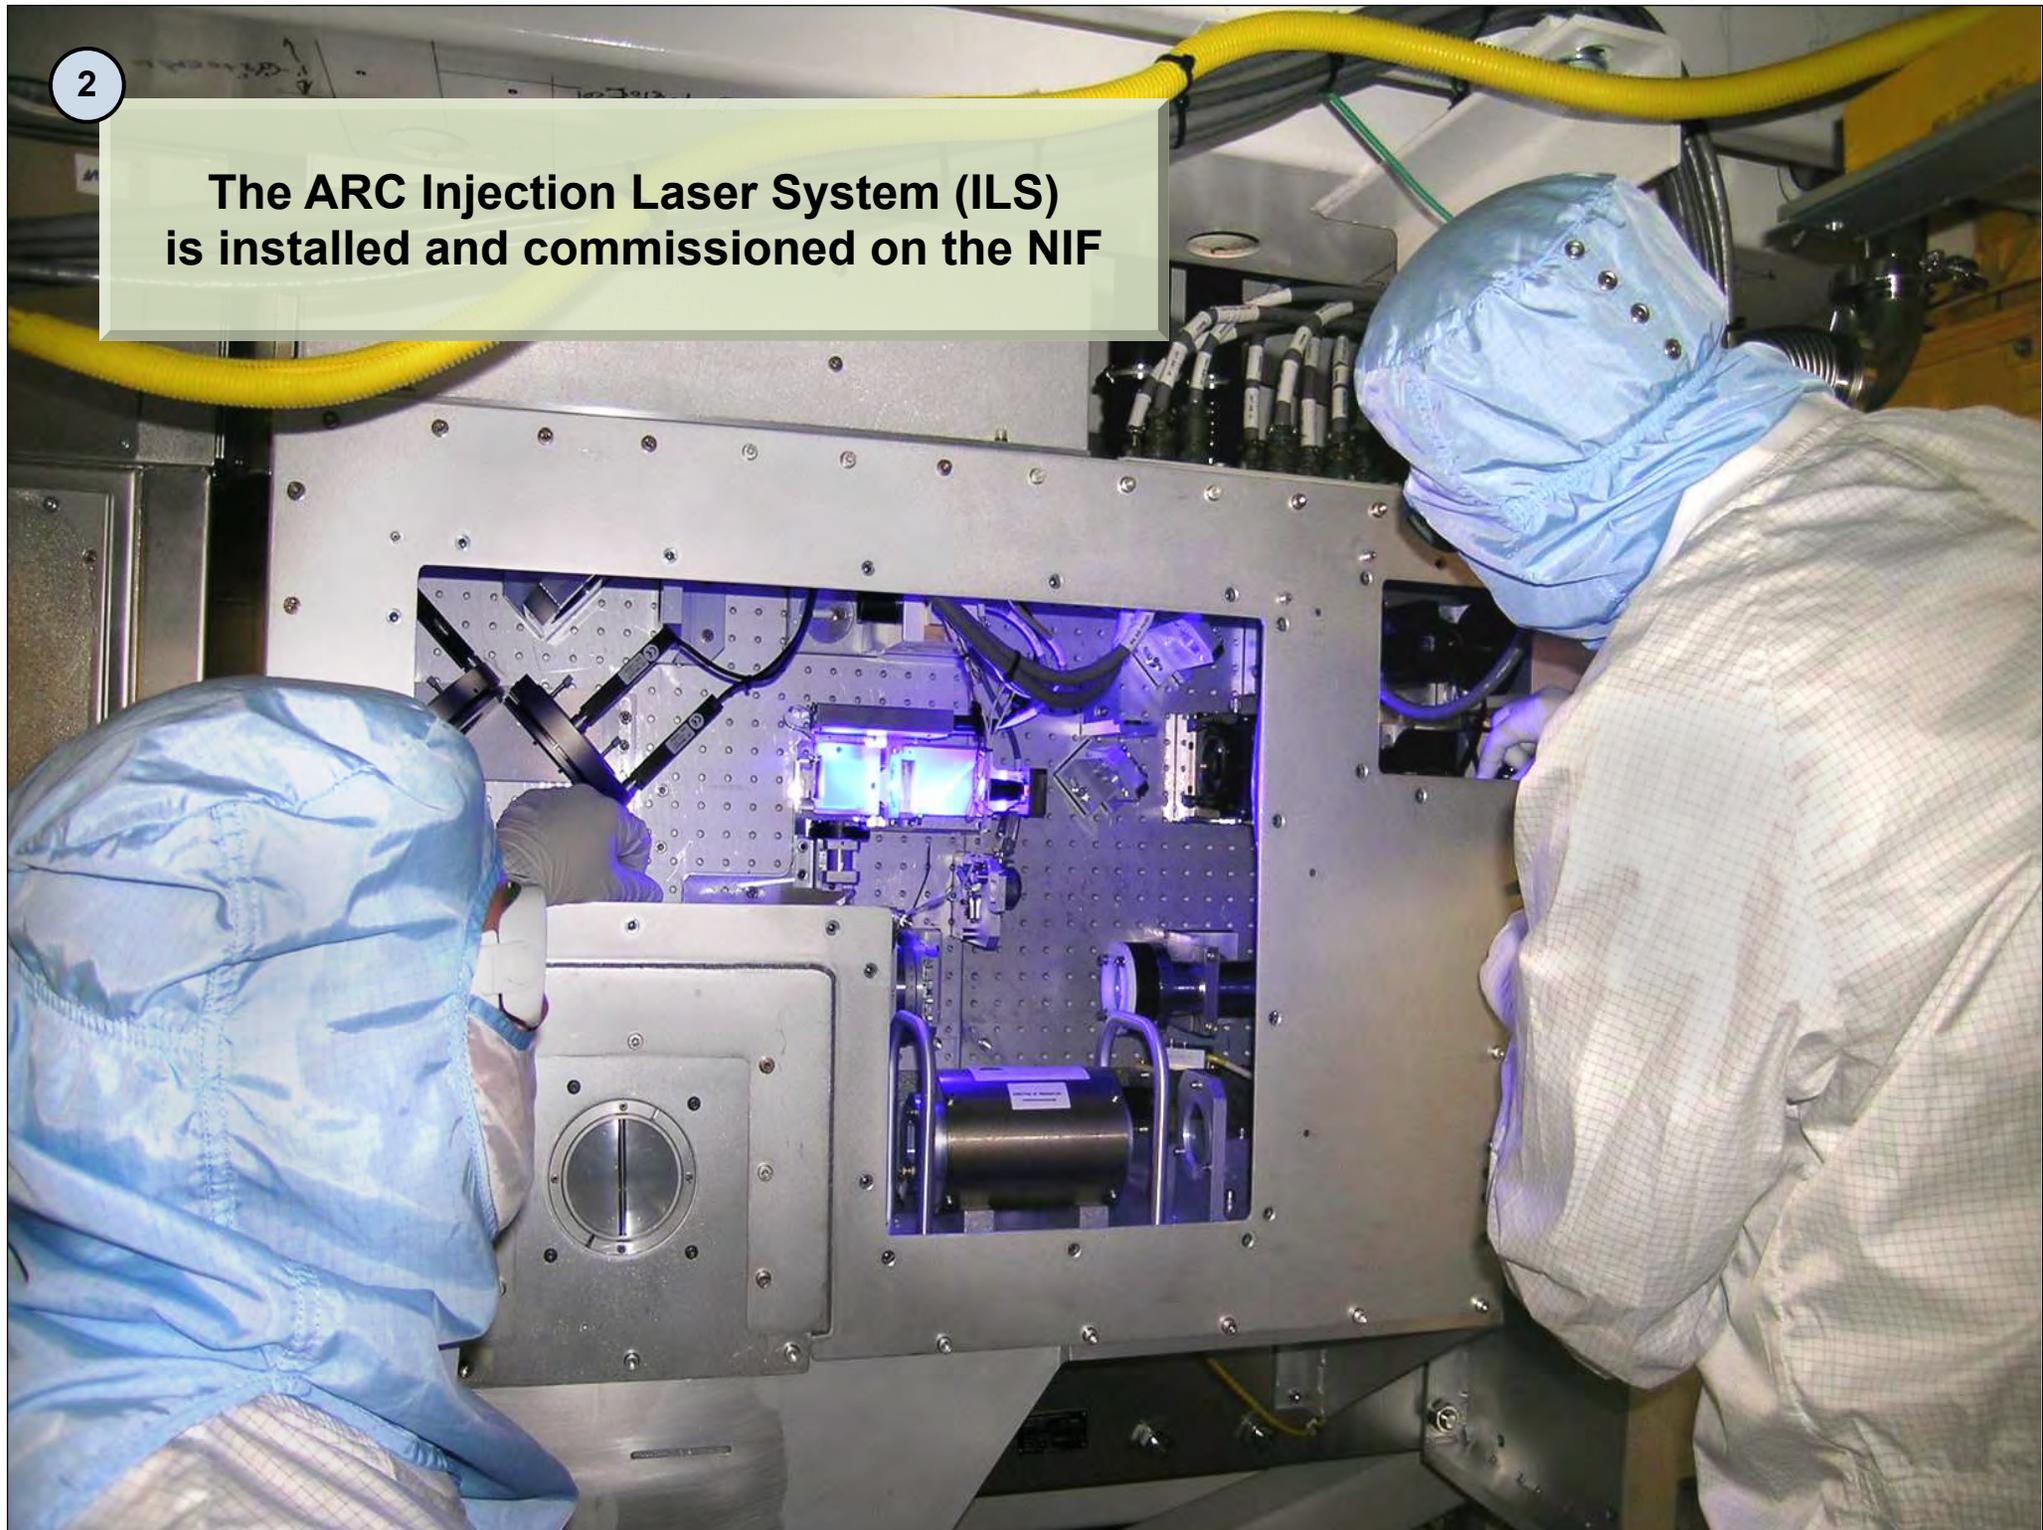

2

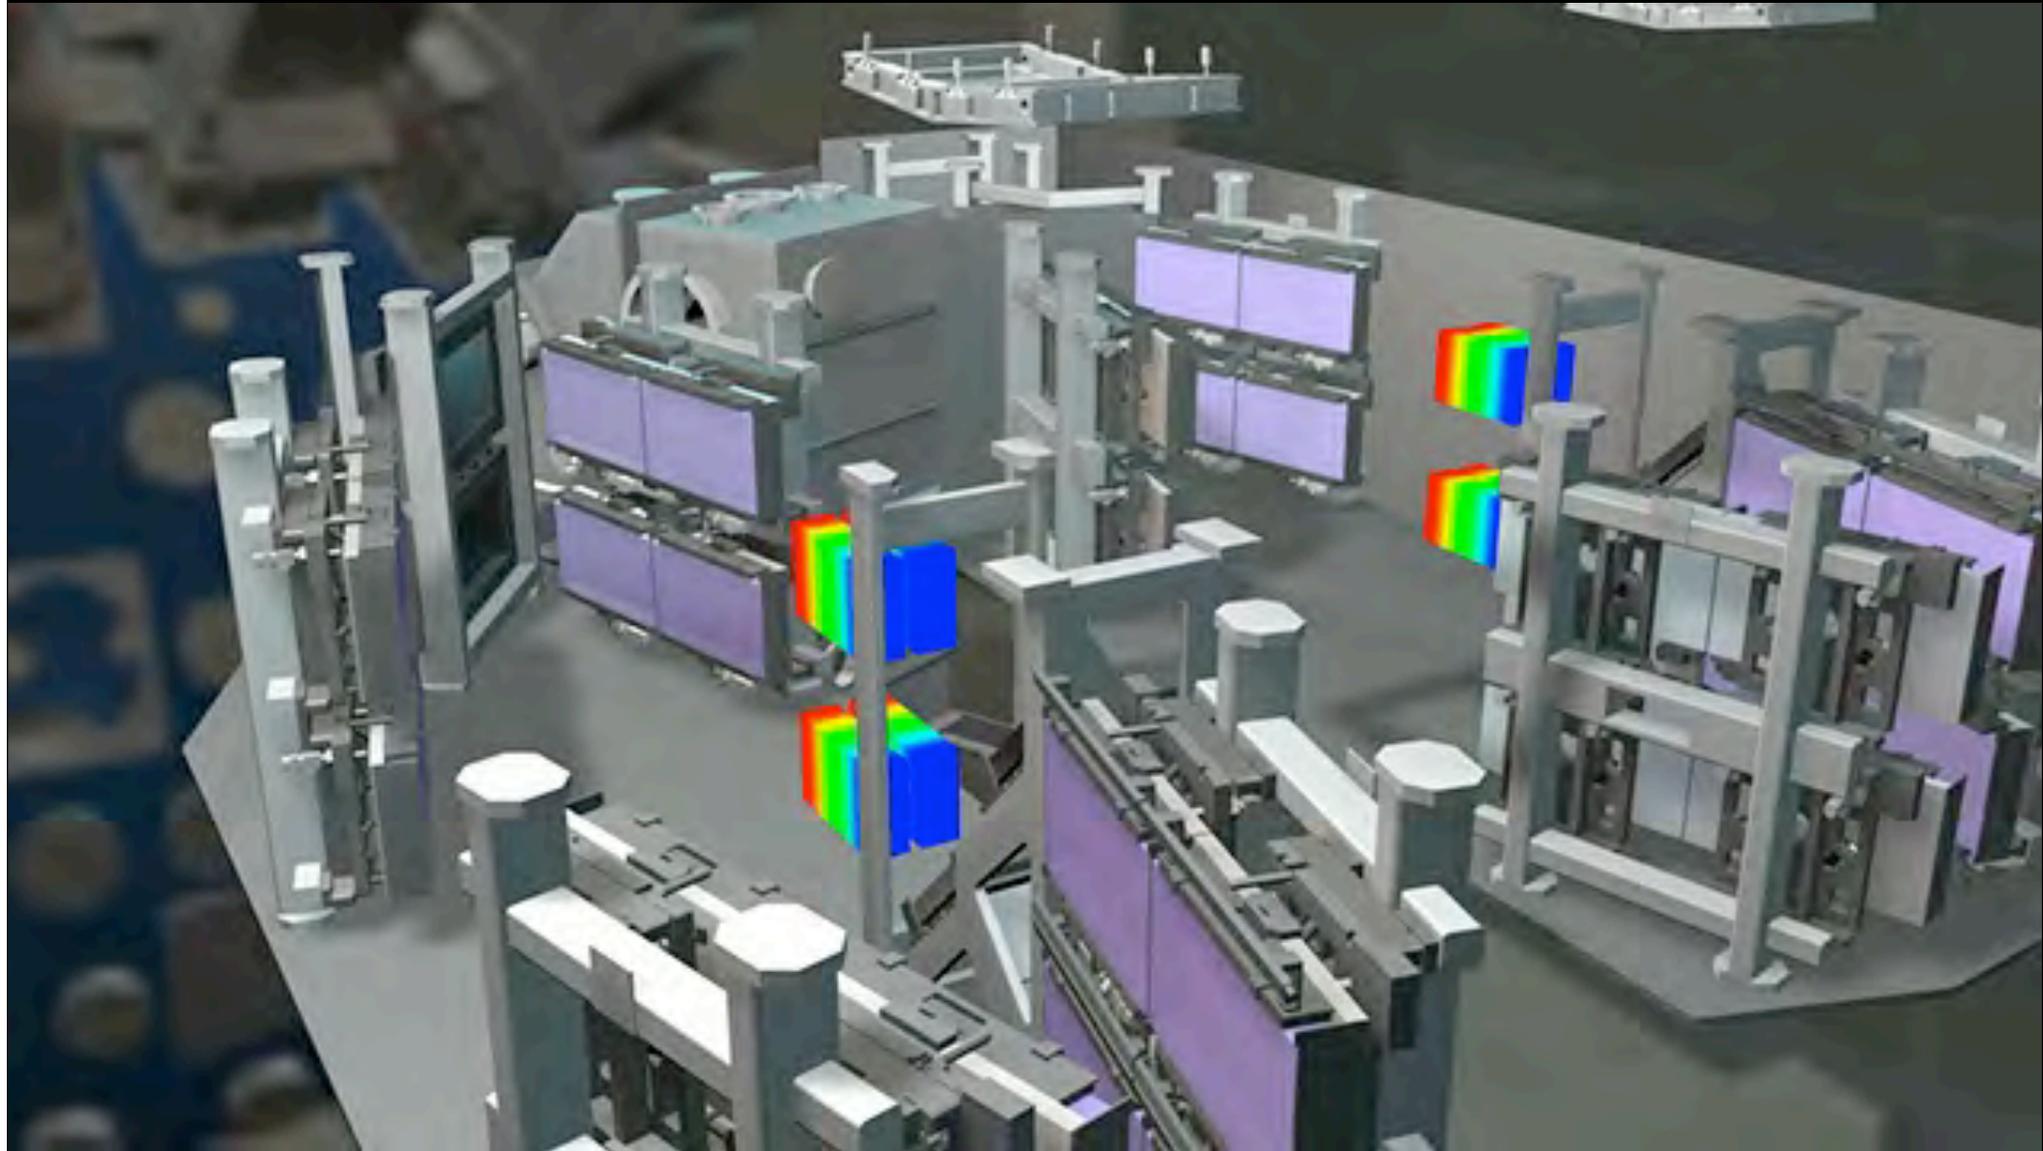

The ARC injection laser system has been performance tested in the ARC testbed facility

2

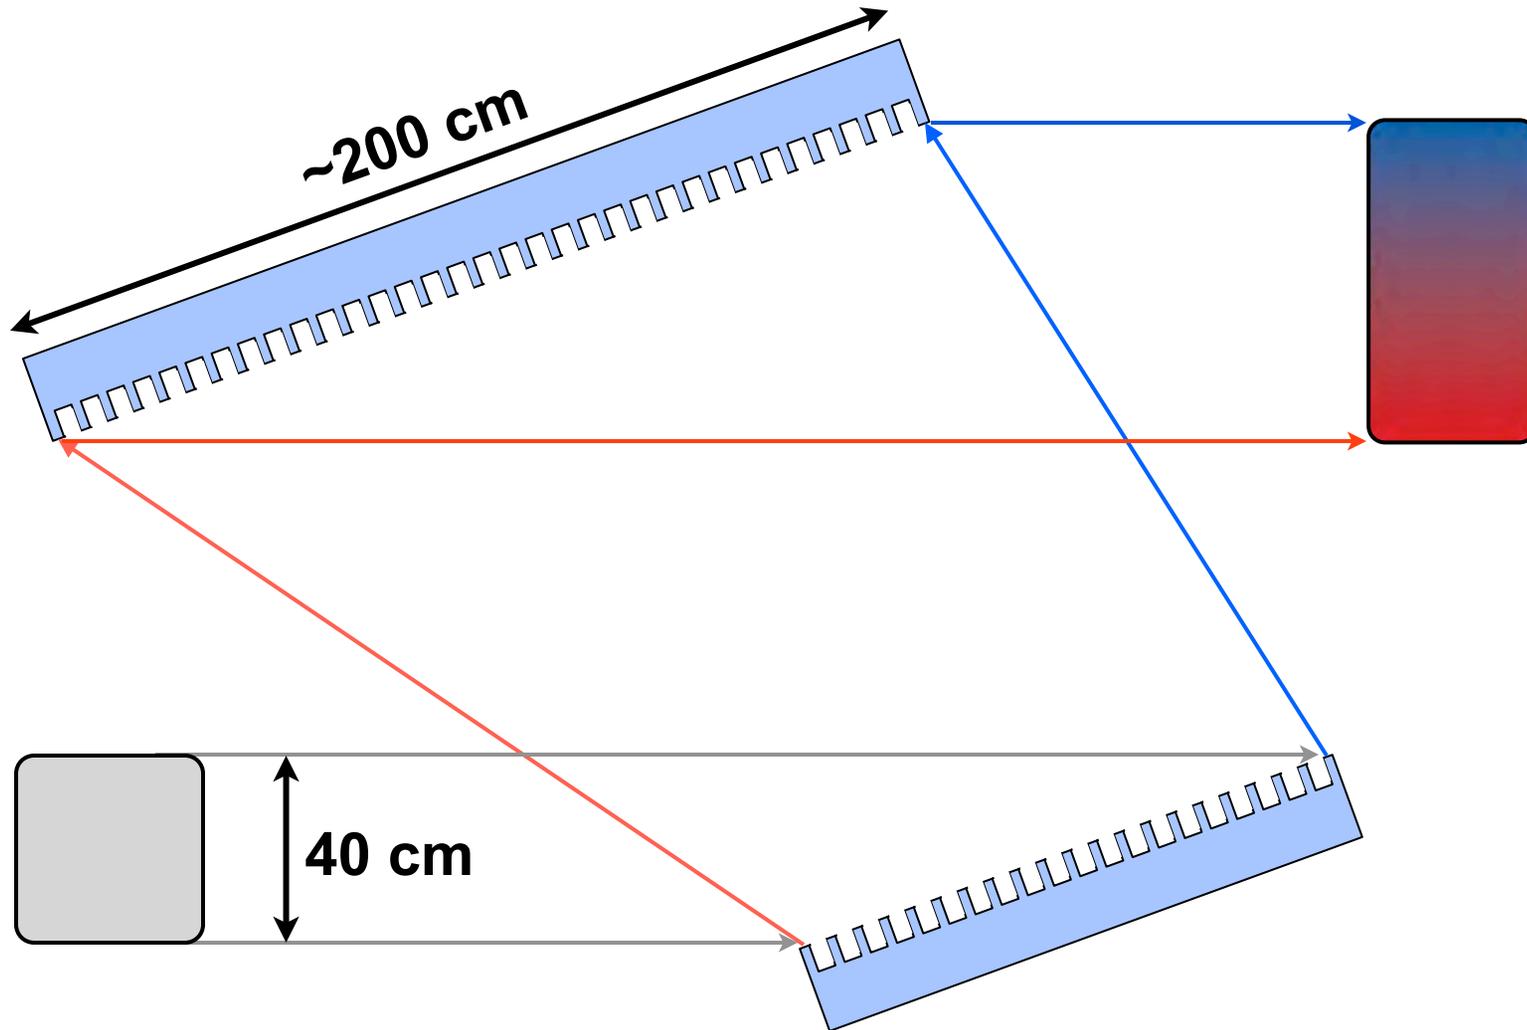

**The ARC Injection Laser System (ILS)
is installed and commissioned on the NIF**

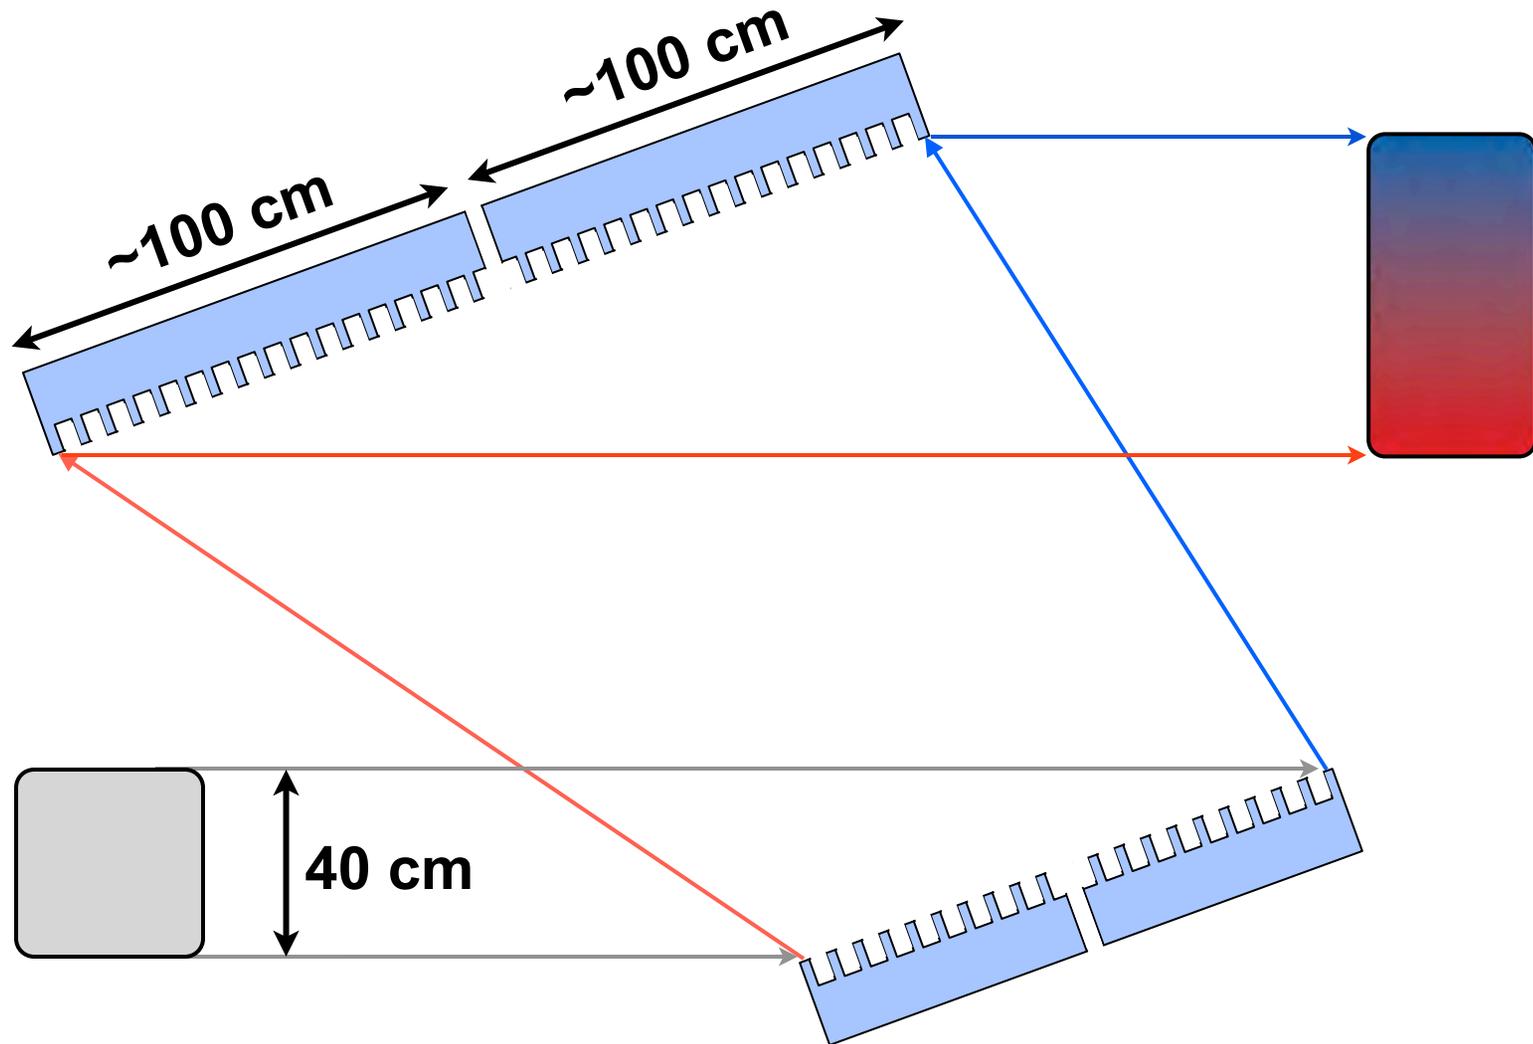

3

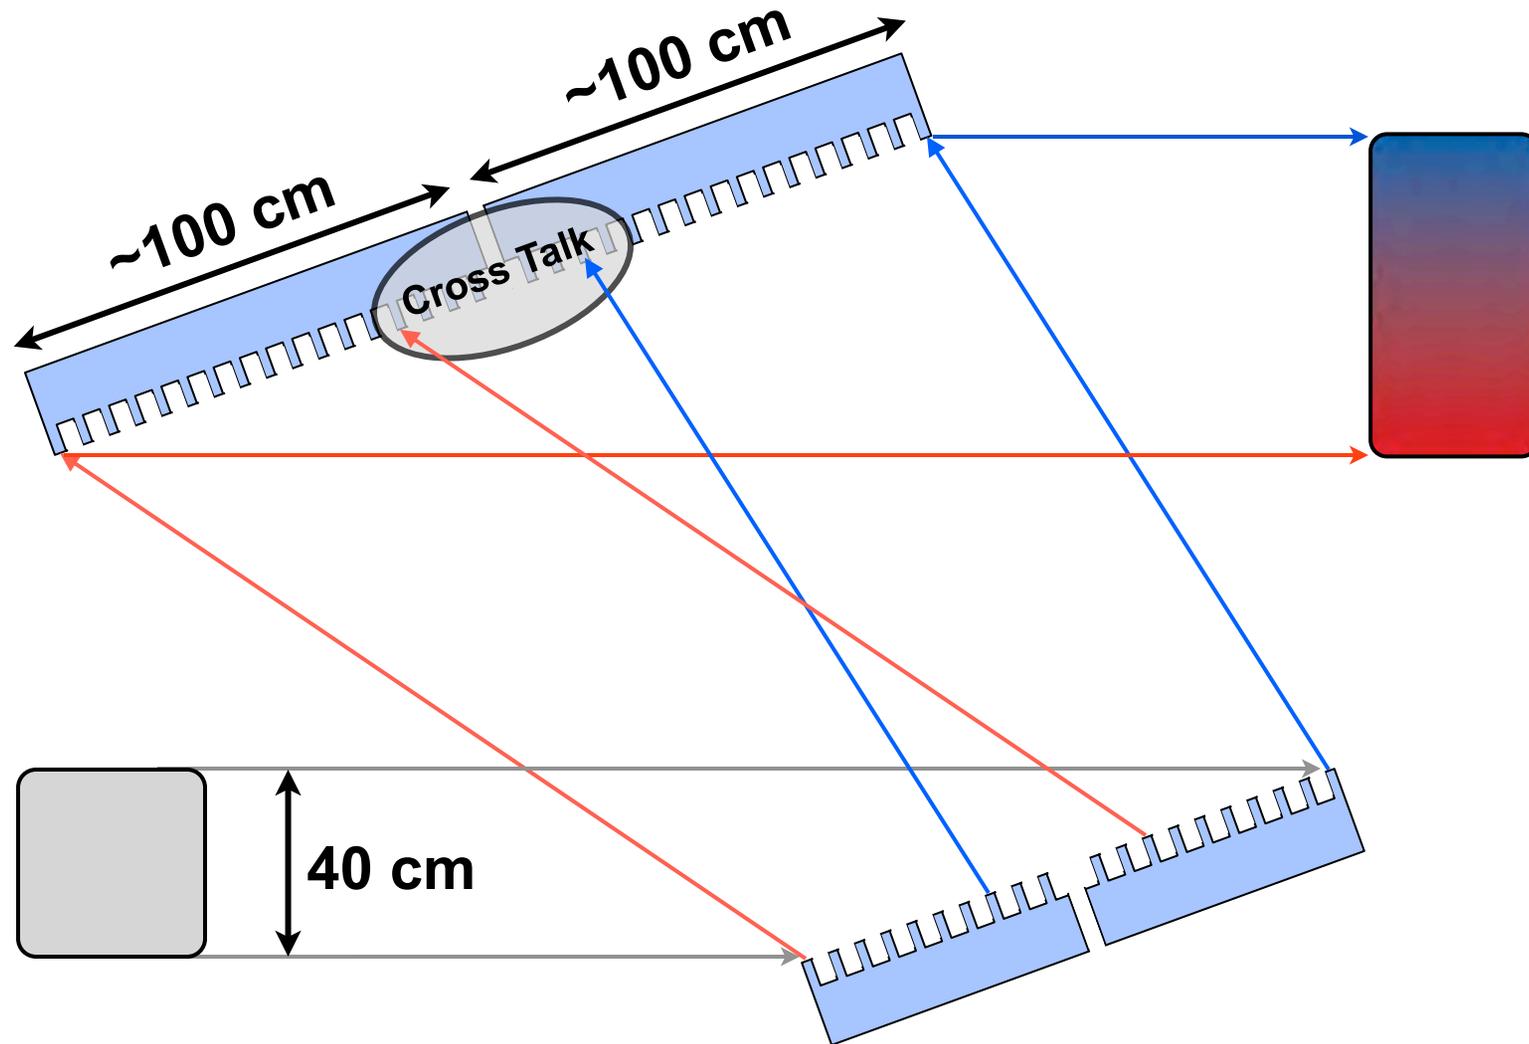

Pulse compression of 40-cm wide beams would require ~2 m gratings

Pulse compression of 40-cm wide beams would require ~2 m gratings OR "tiling of smaller gratings

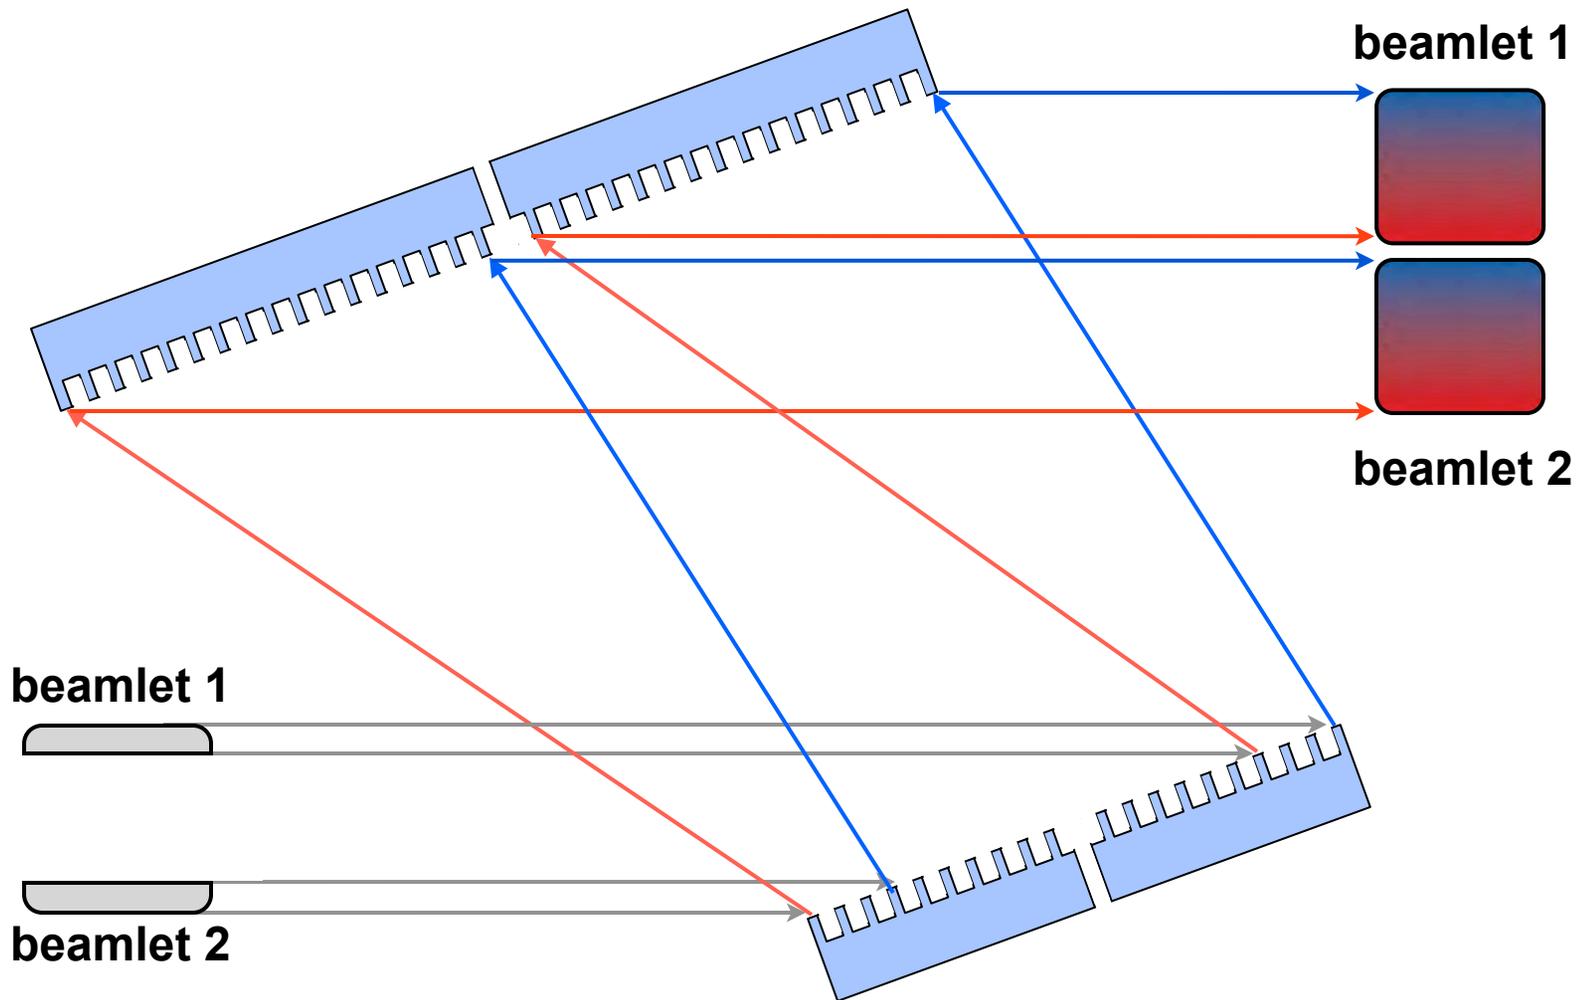

Pulse compression of 40-cm wide beams would require ~2 m gratings OR “tiling of smaller gratings

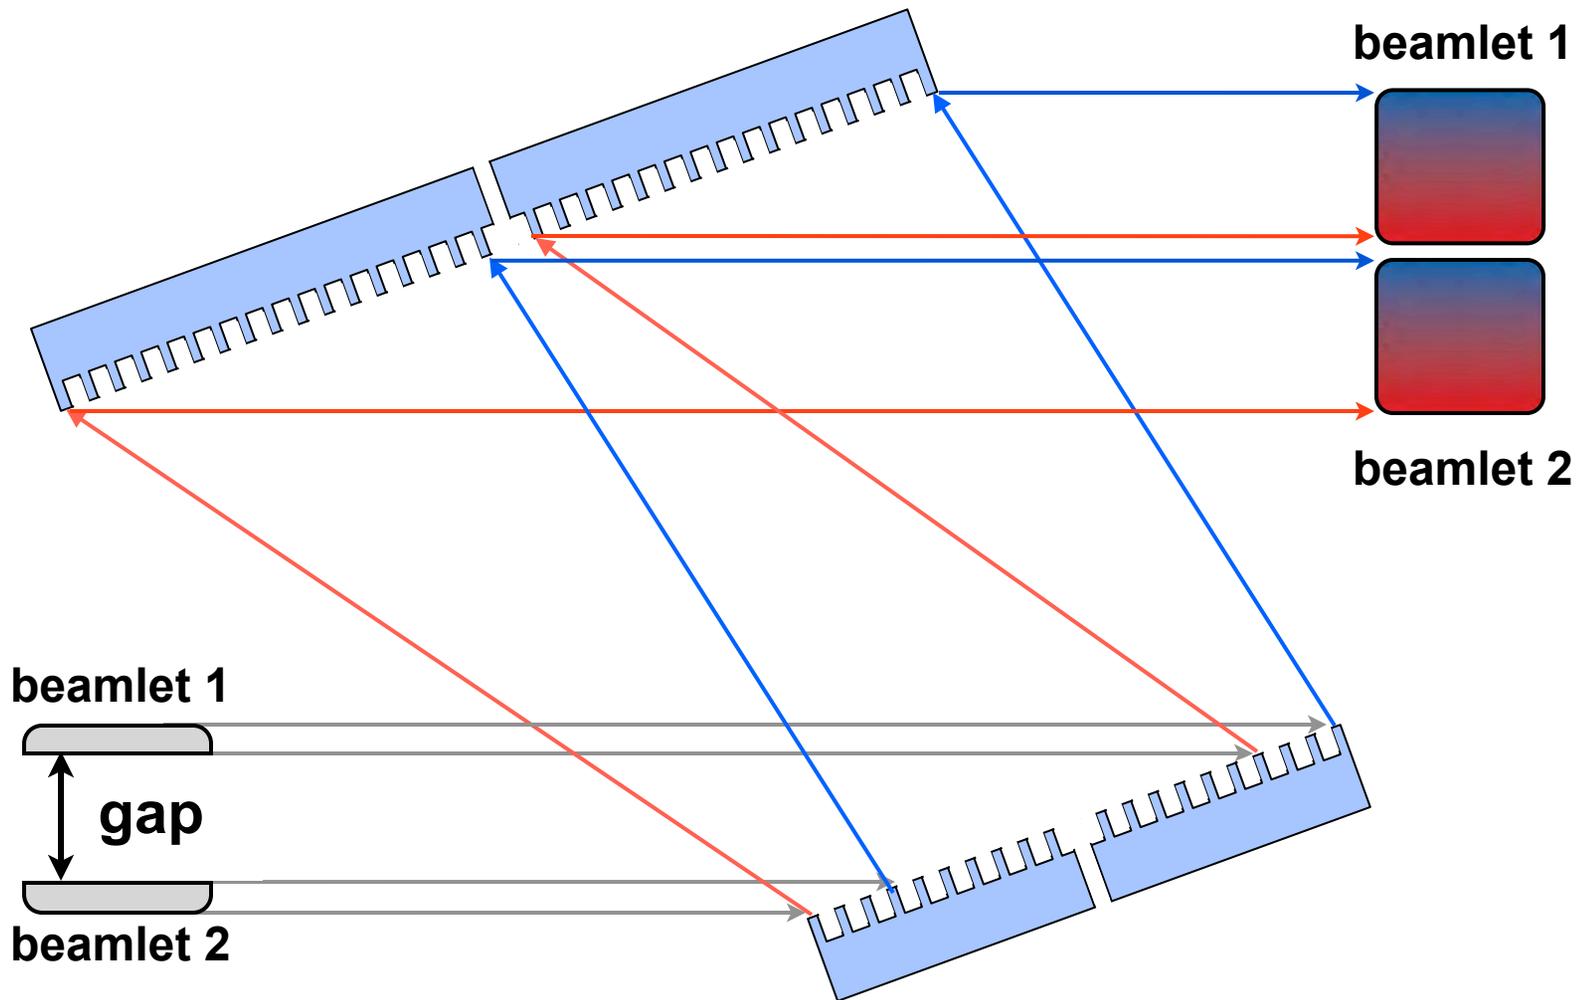

Tiling must be done “coherently” to avoid cross talk issues

The NIF beam is split prior to amplification to avoid cross talk & the need to coherently “tile” gratings,

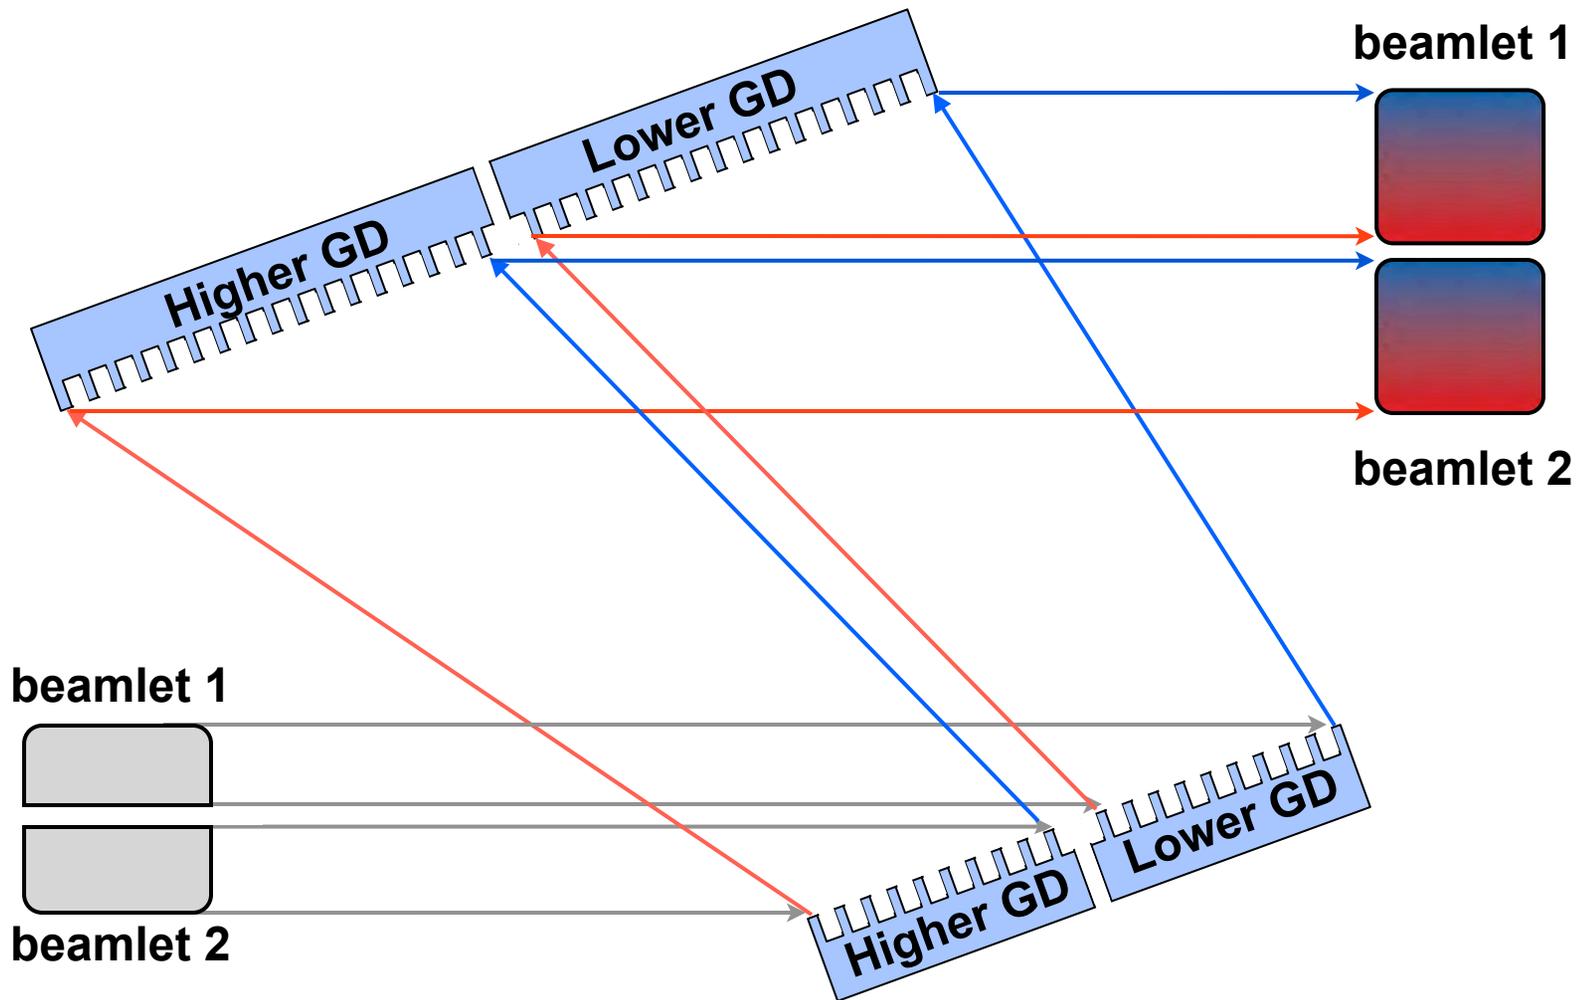

Two independent pulse compressors with double the outputs for back lighting

The NIF beam is split prior to amplification to avoid cross talk & the need to coherently “tile” gratings,

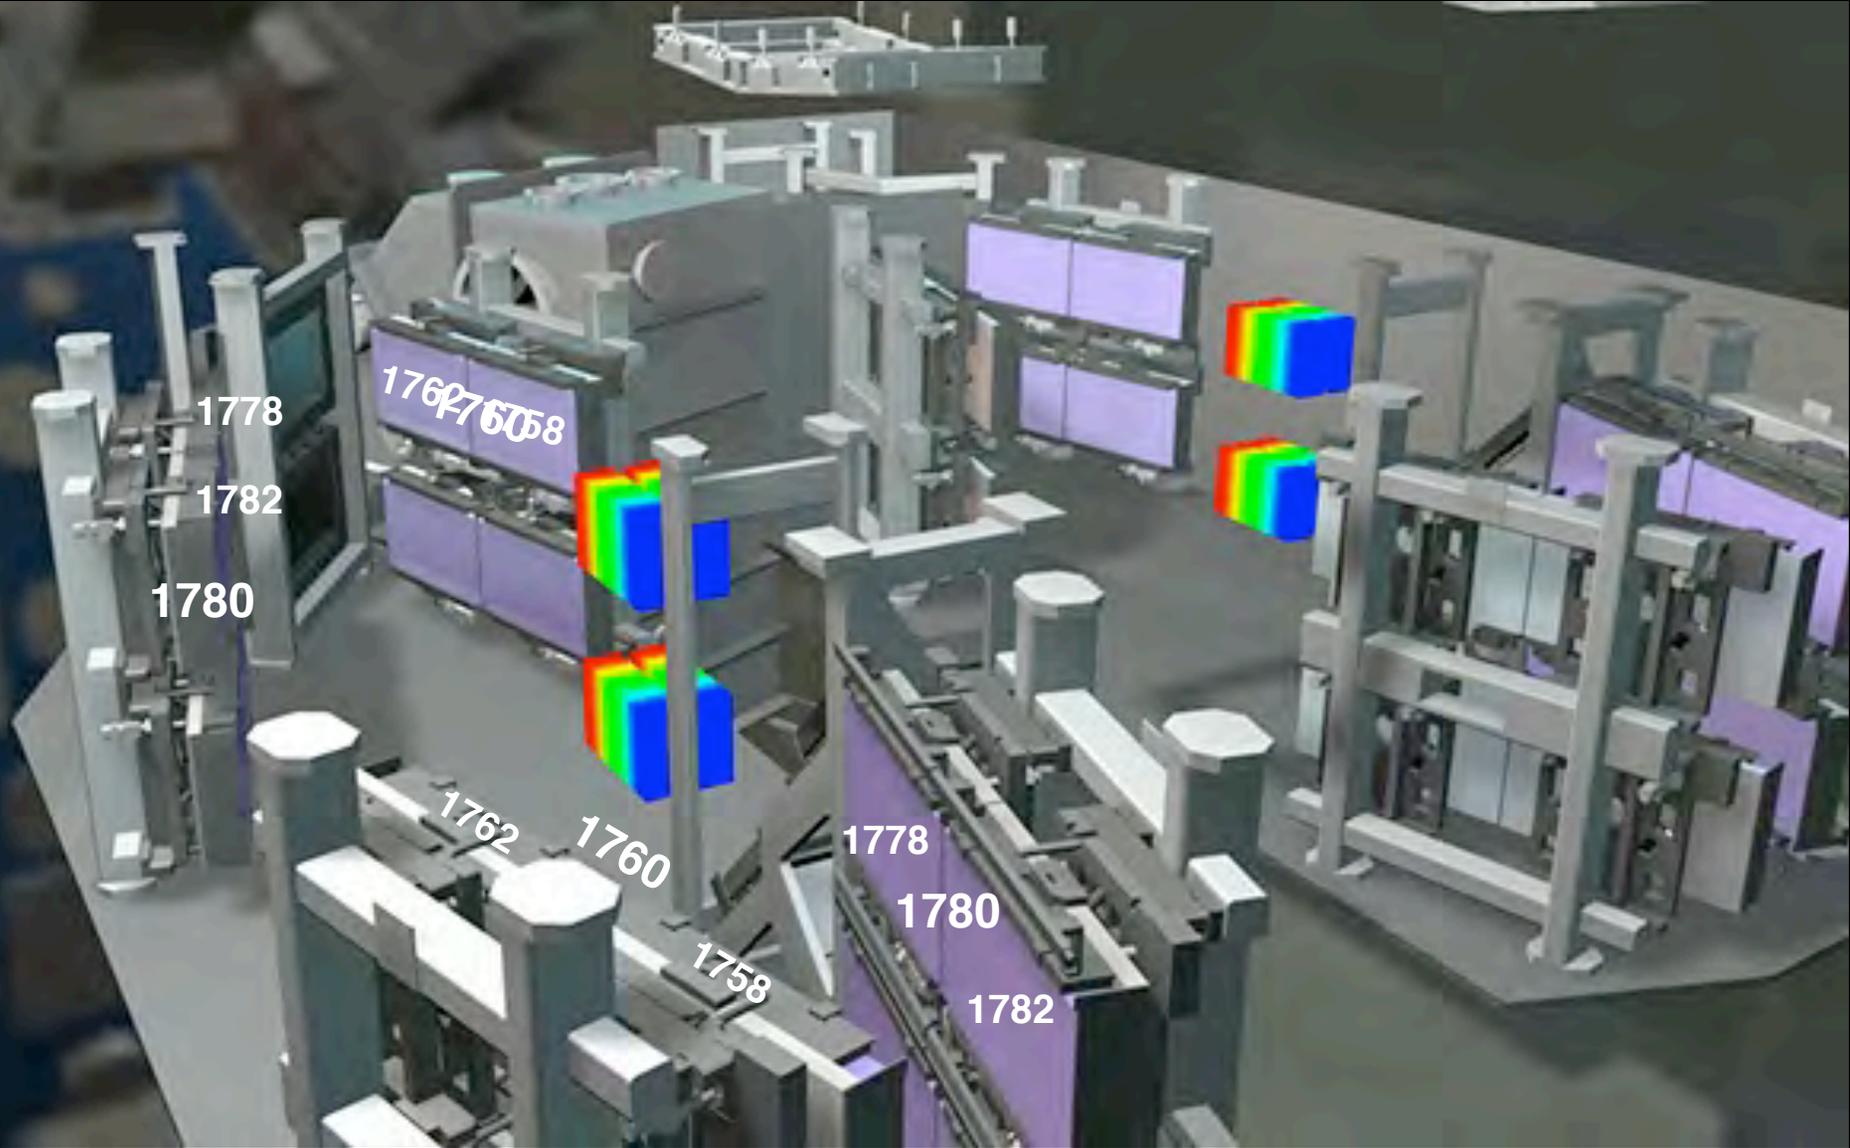

However the gap between the beams corresponds to an unwanted loss of energy

To avoid cross talk & the need to coherently “tile” gratings, the NIF beam is split prior to amplification

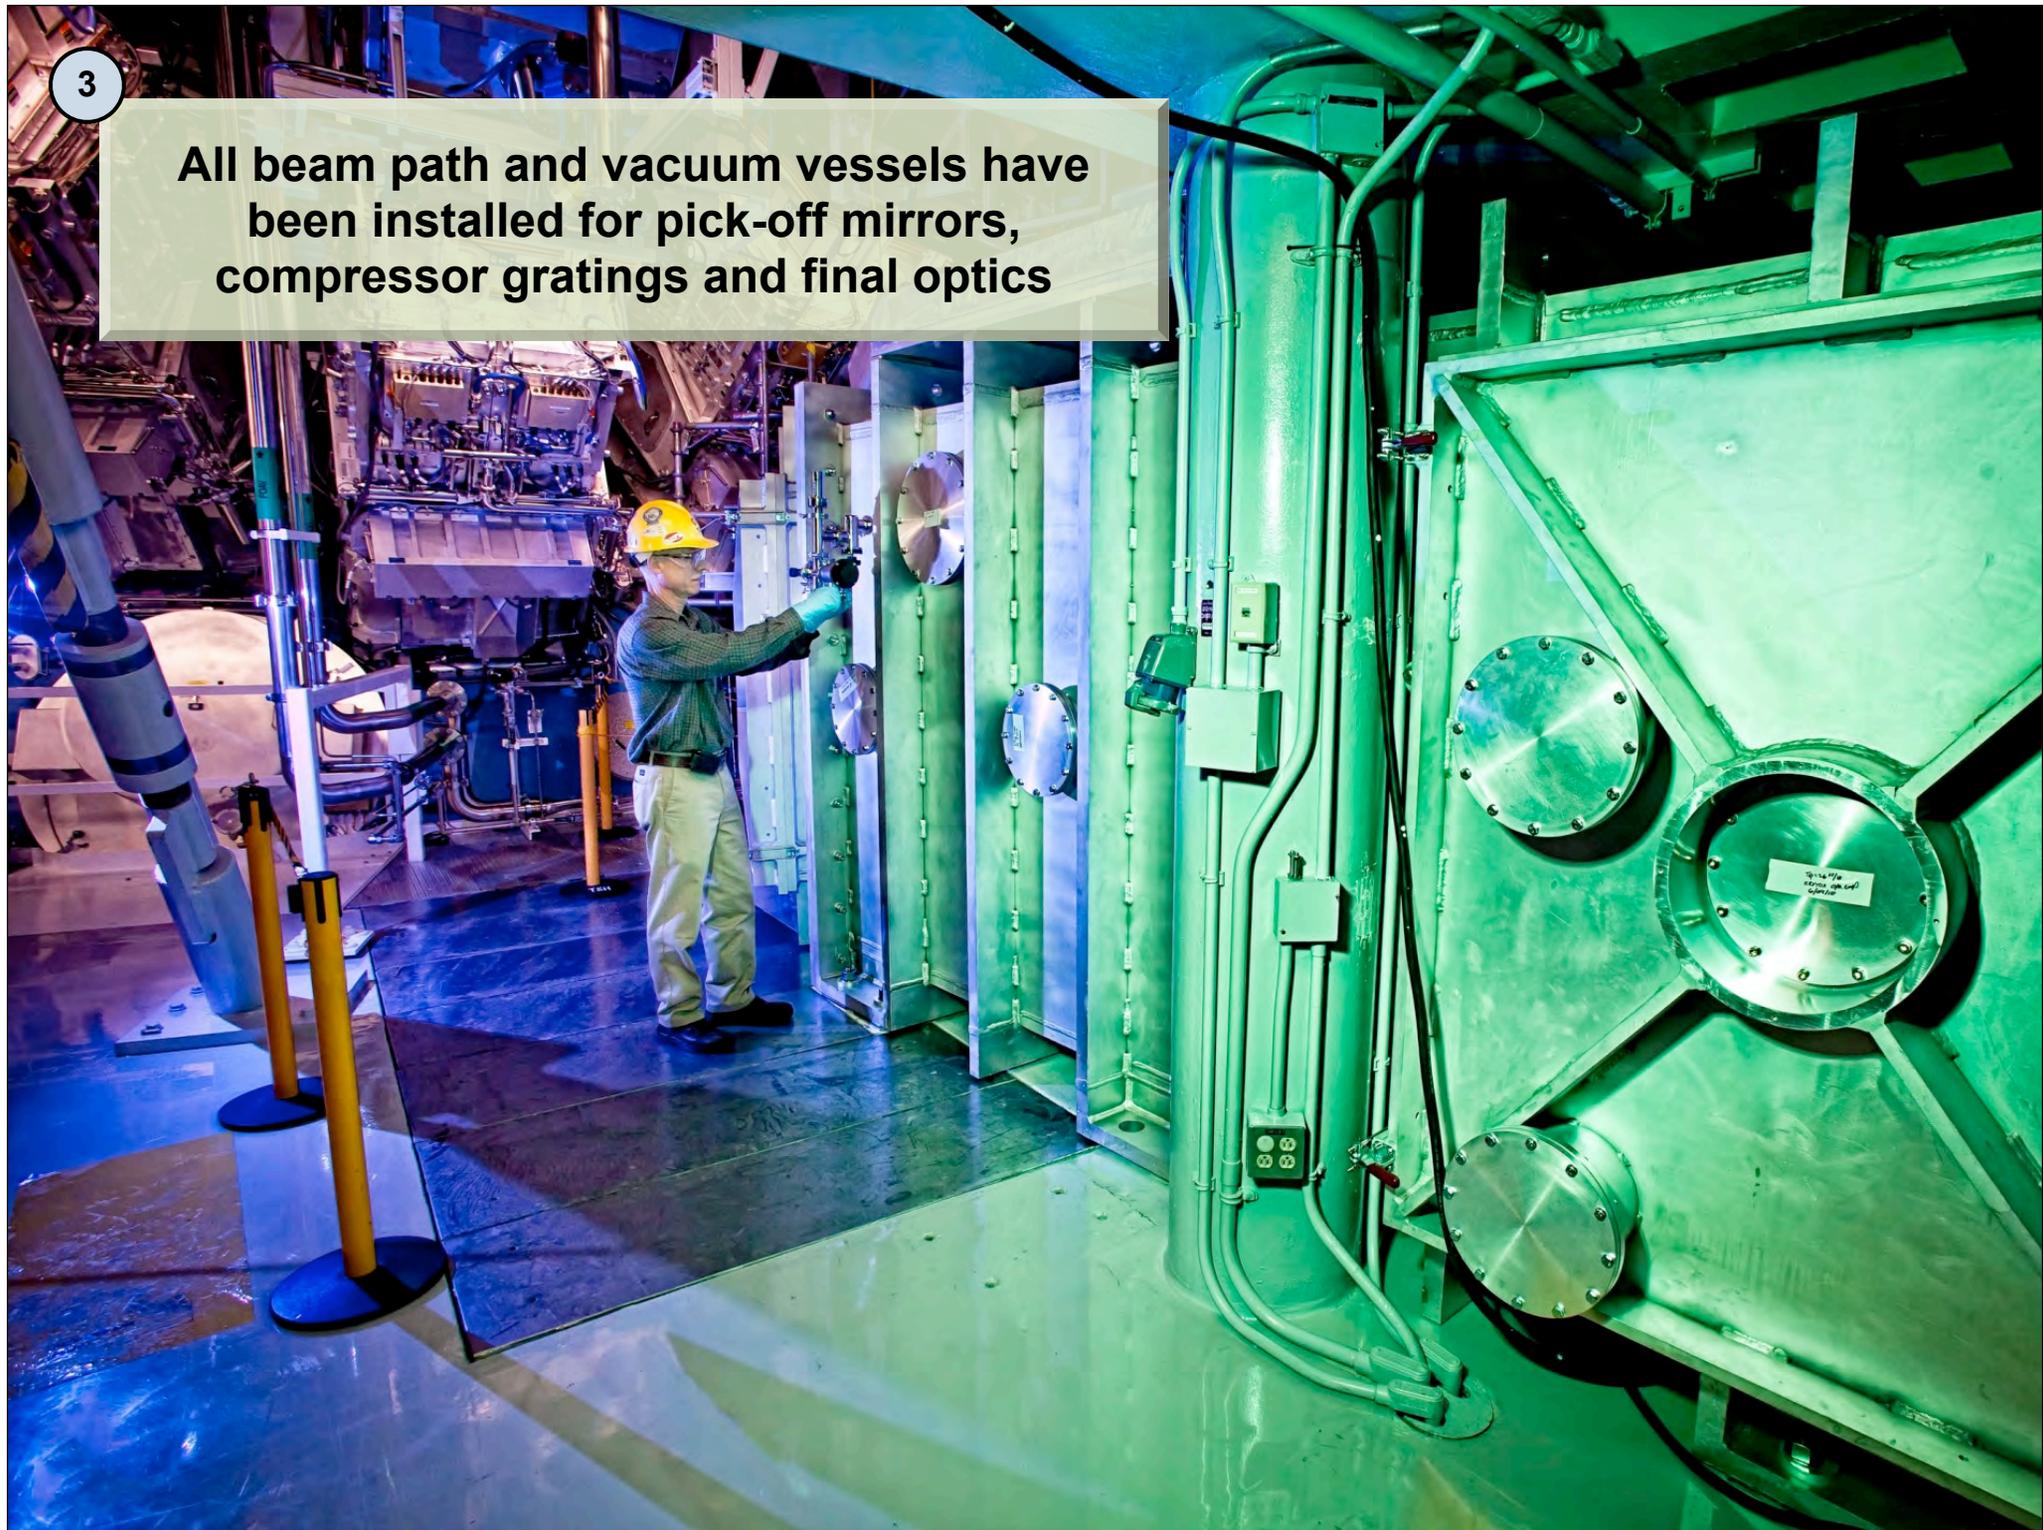

Beamlet energy is increased by slight modification of the left & right grating pairs

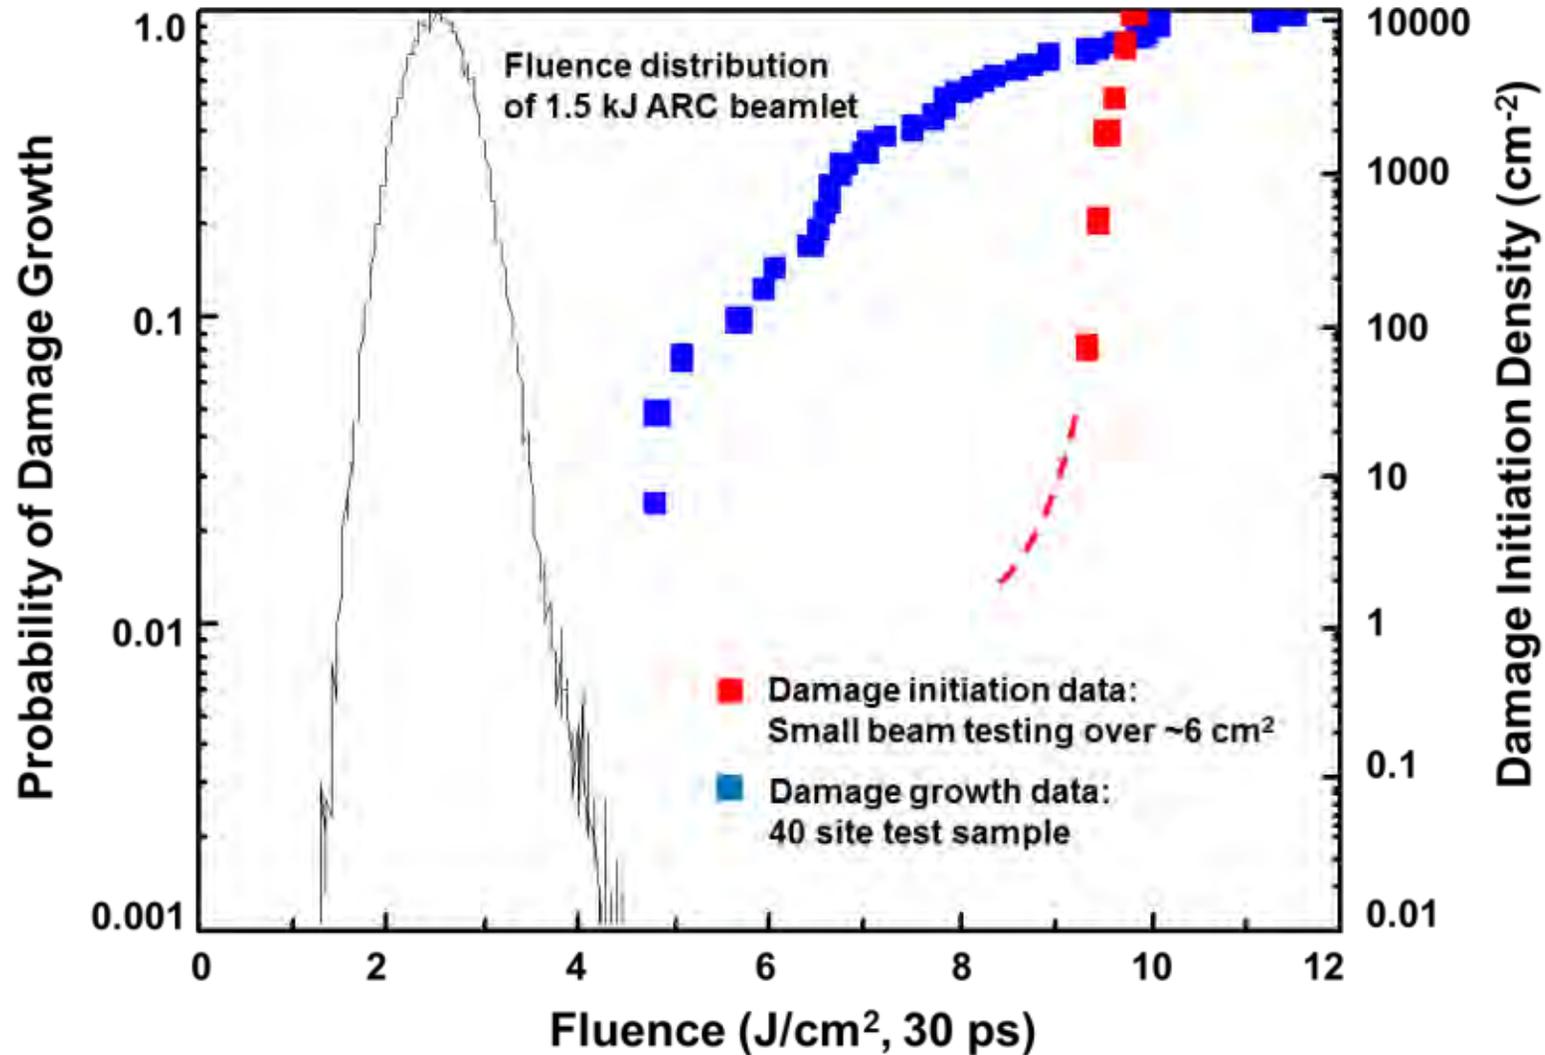

3

All beam path and vacuum vessels have been installed for pick-off mirrors, compressor gratings and final optics

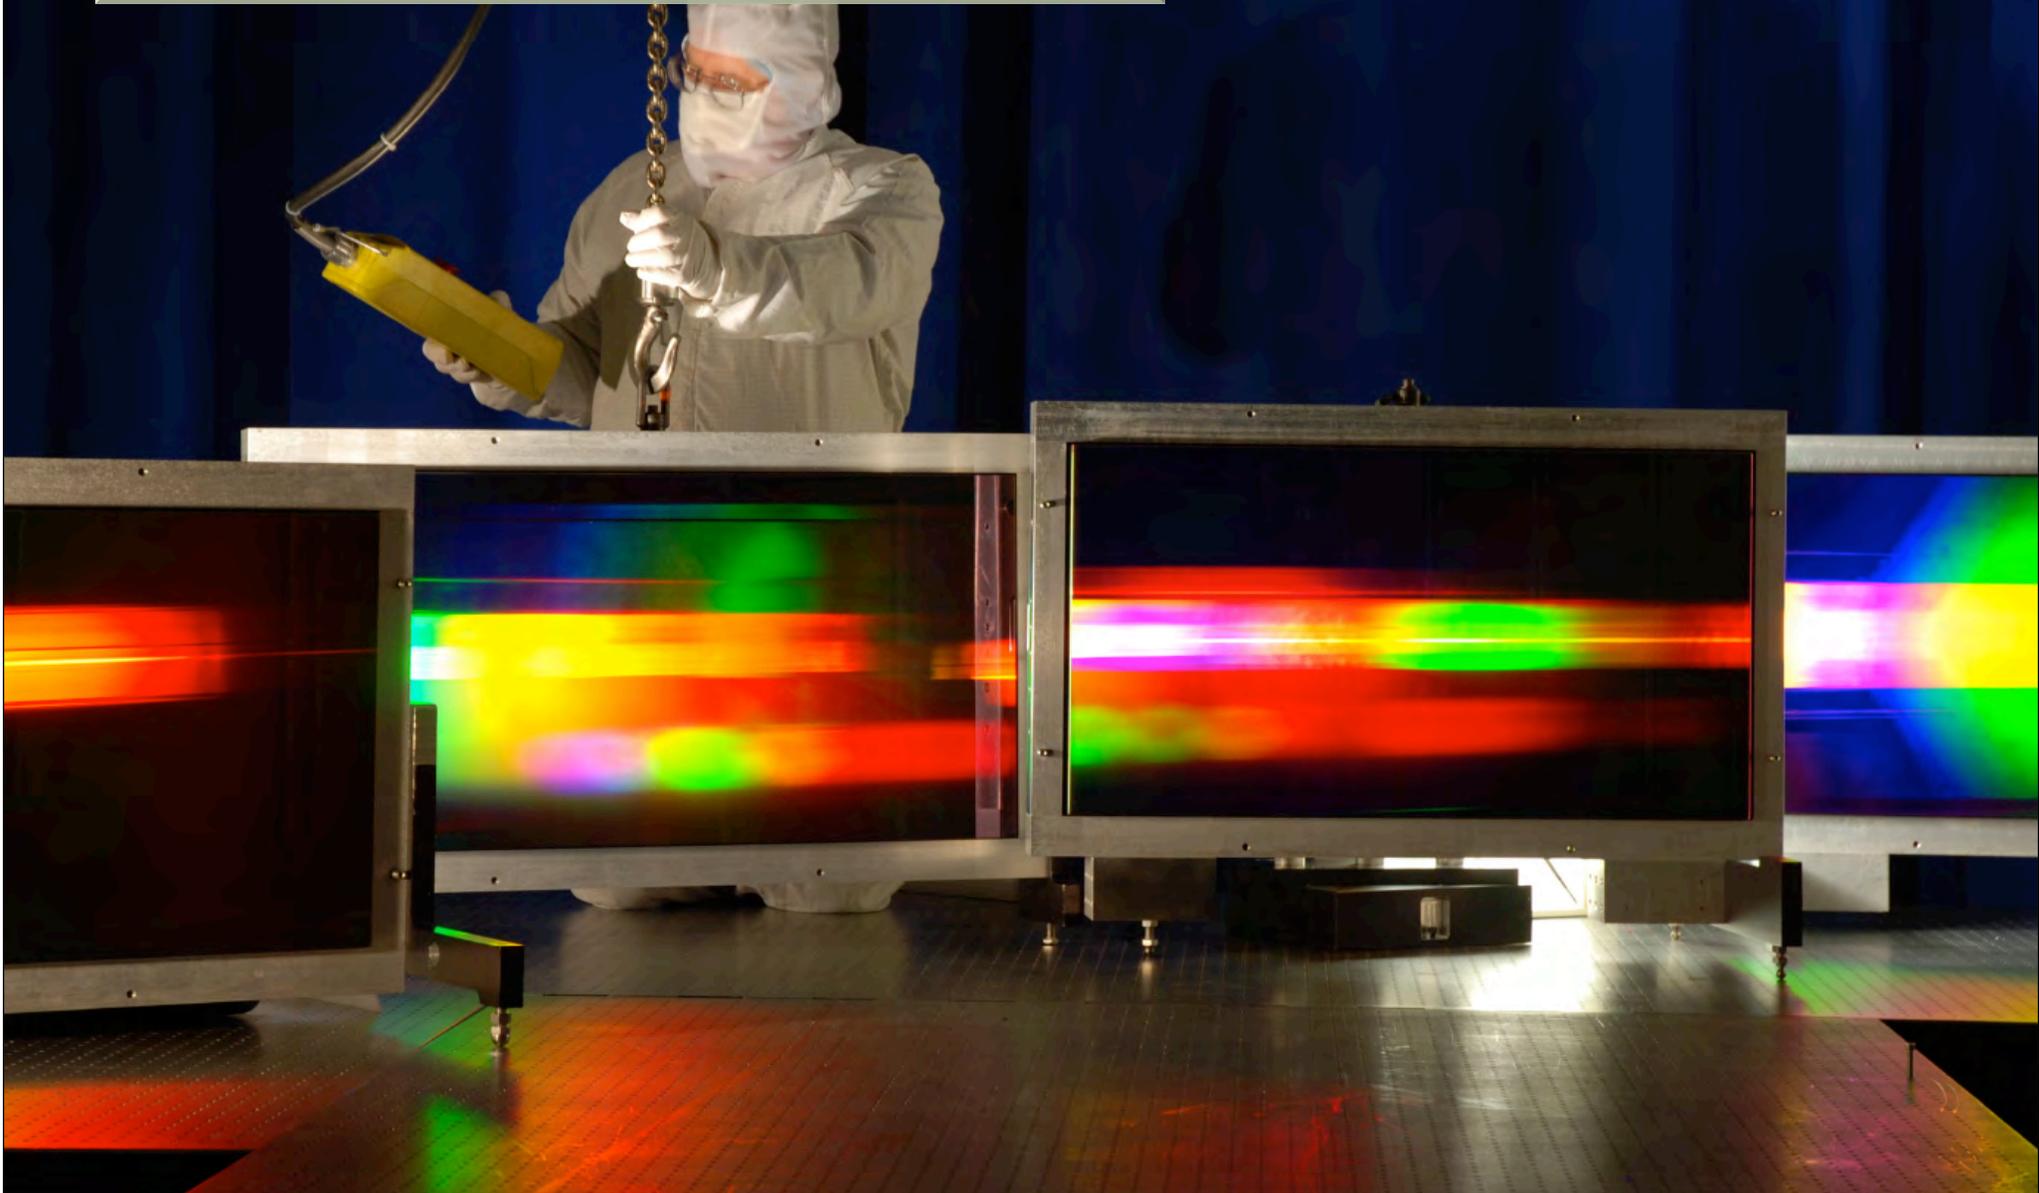

Damage test data of ARC multi-layer dielectric grating samples supports >1.5 kJ per beamlet

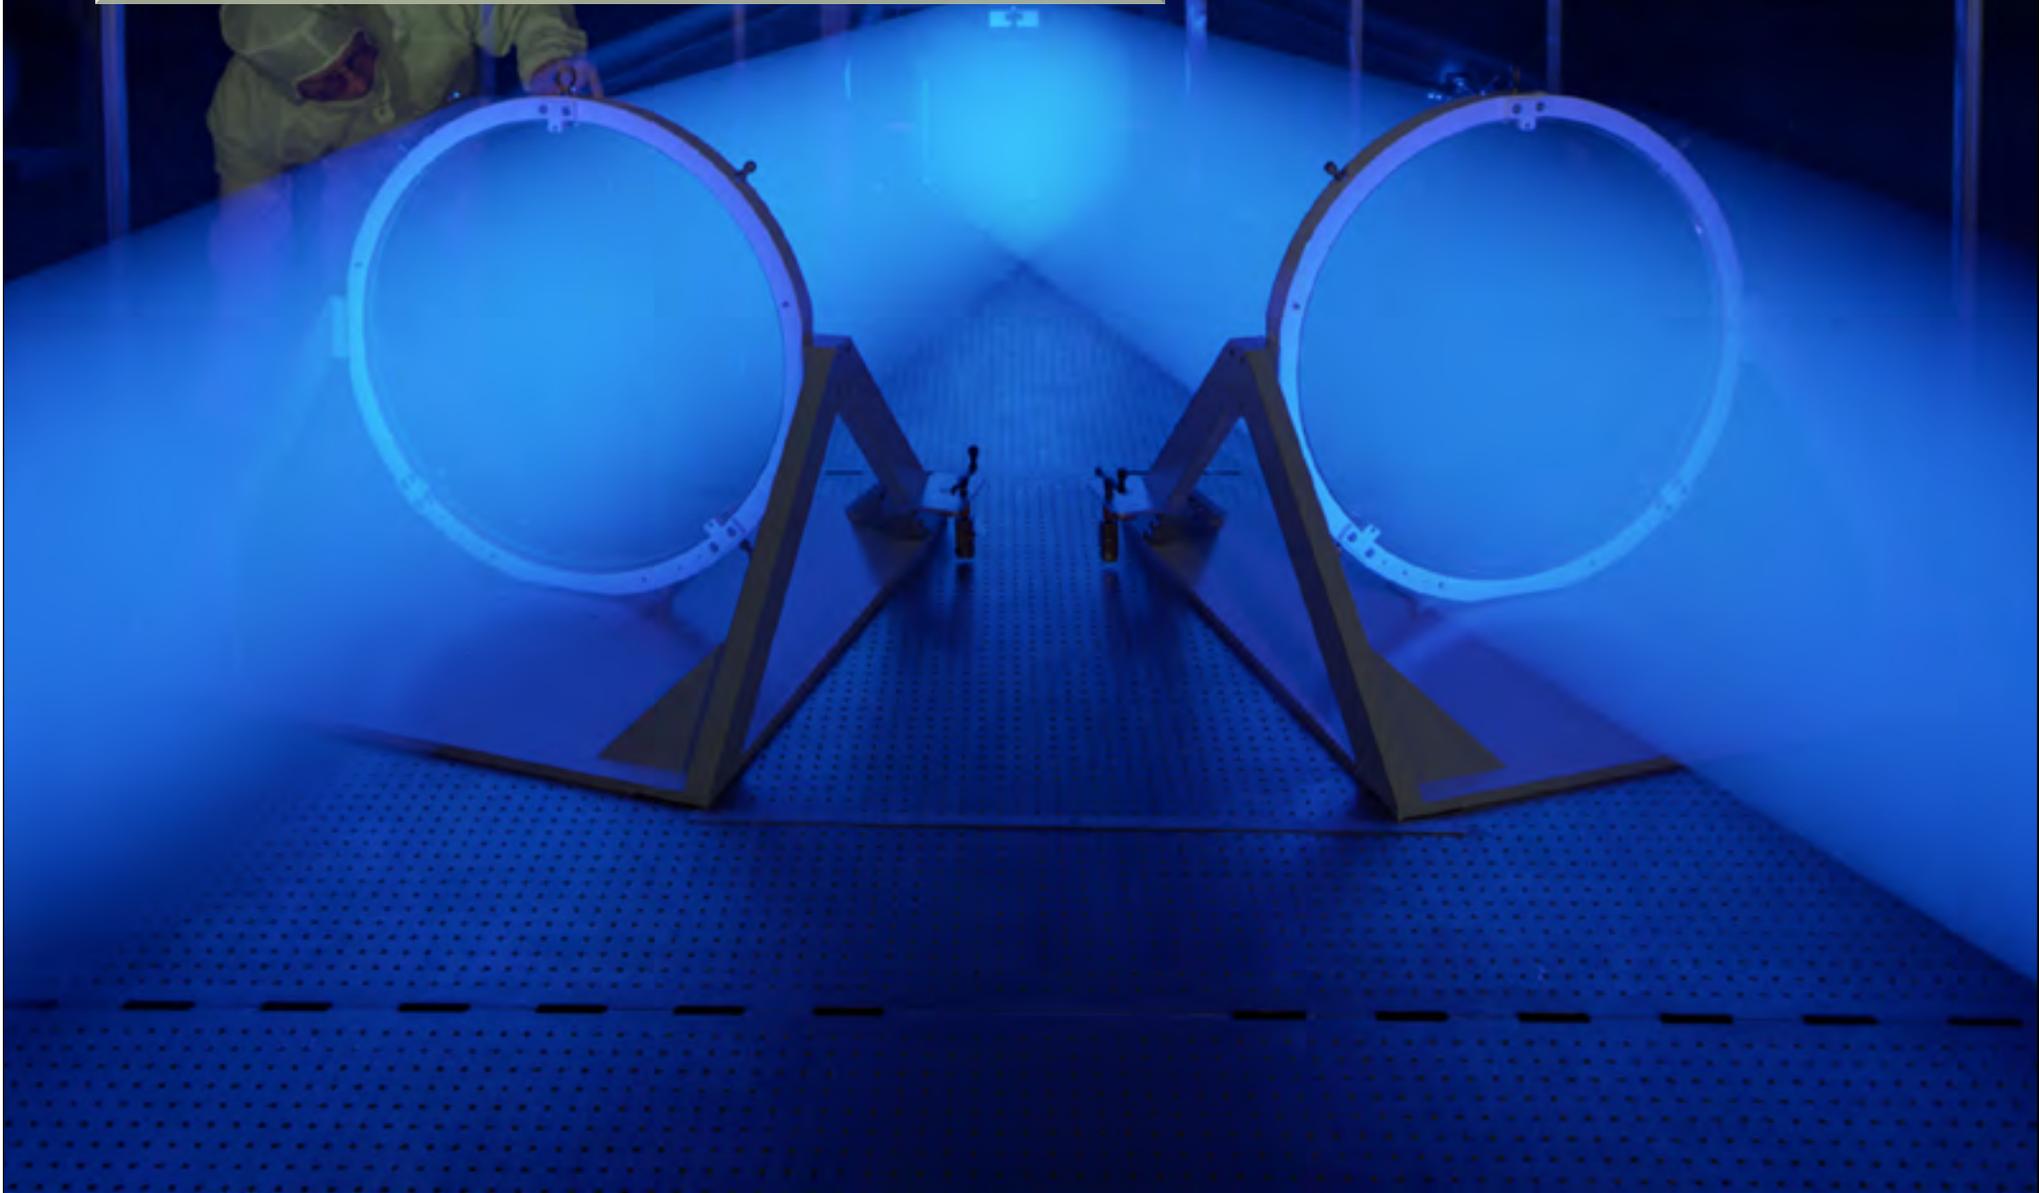

3

**In-house MLD grating fabrication is complete
81cm x 45cm & 91cm x 45cm by 10cm thick
Average diffraction efficiency 96.8%**

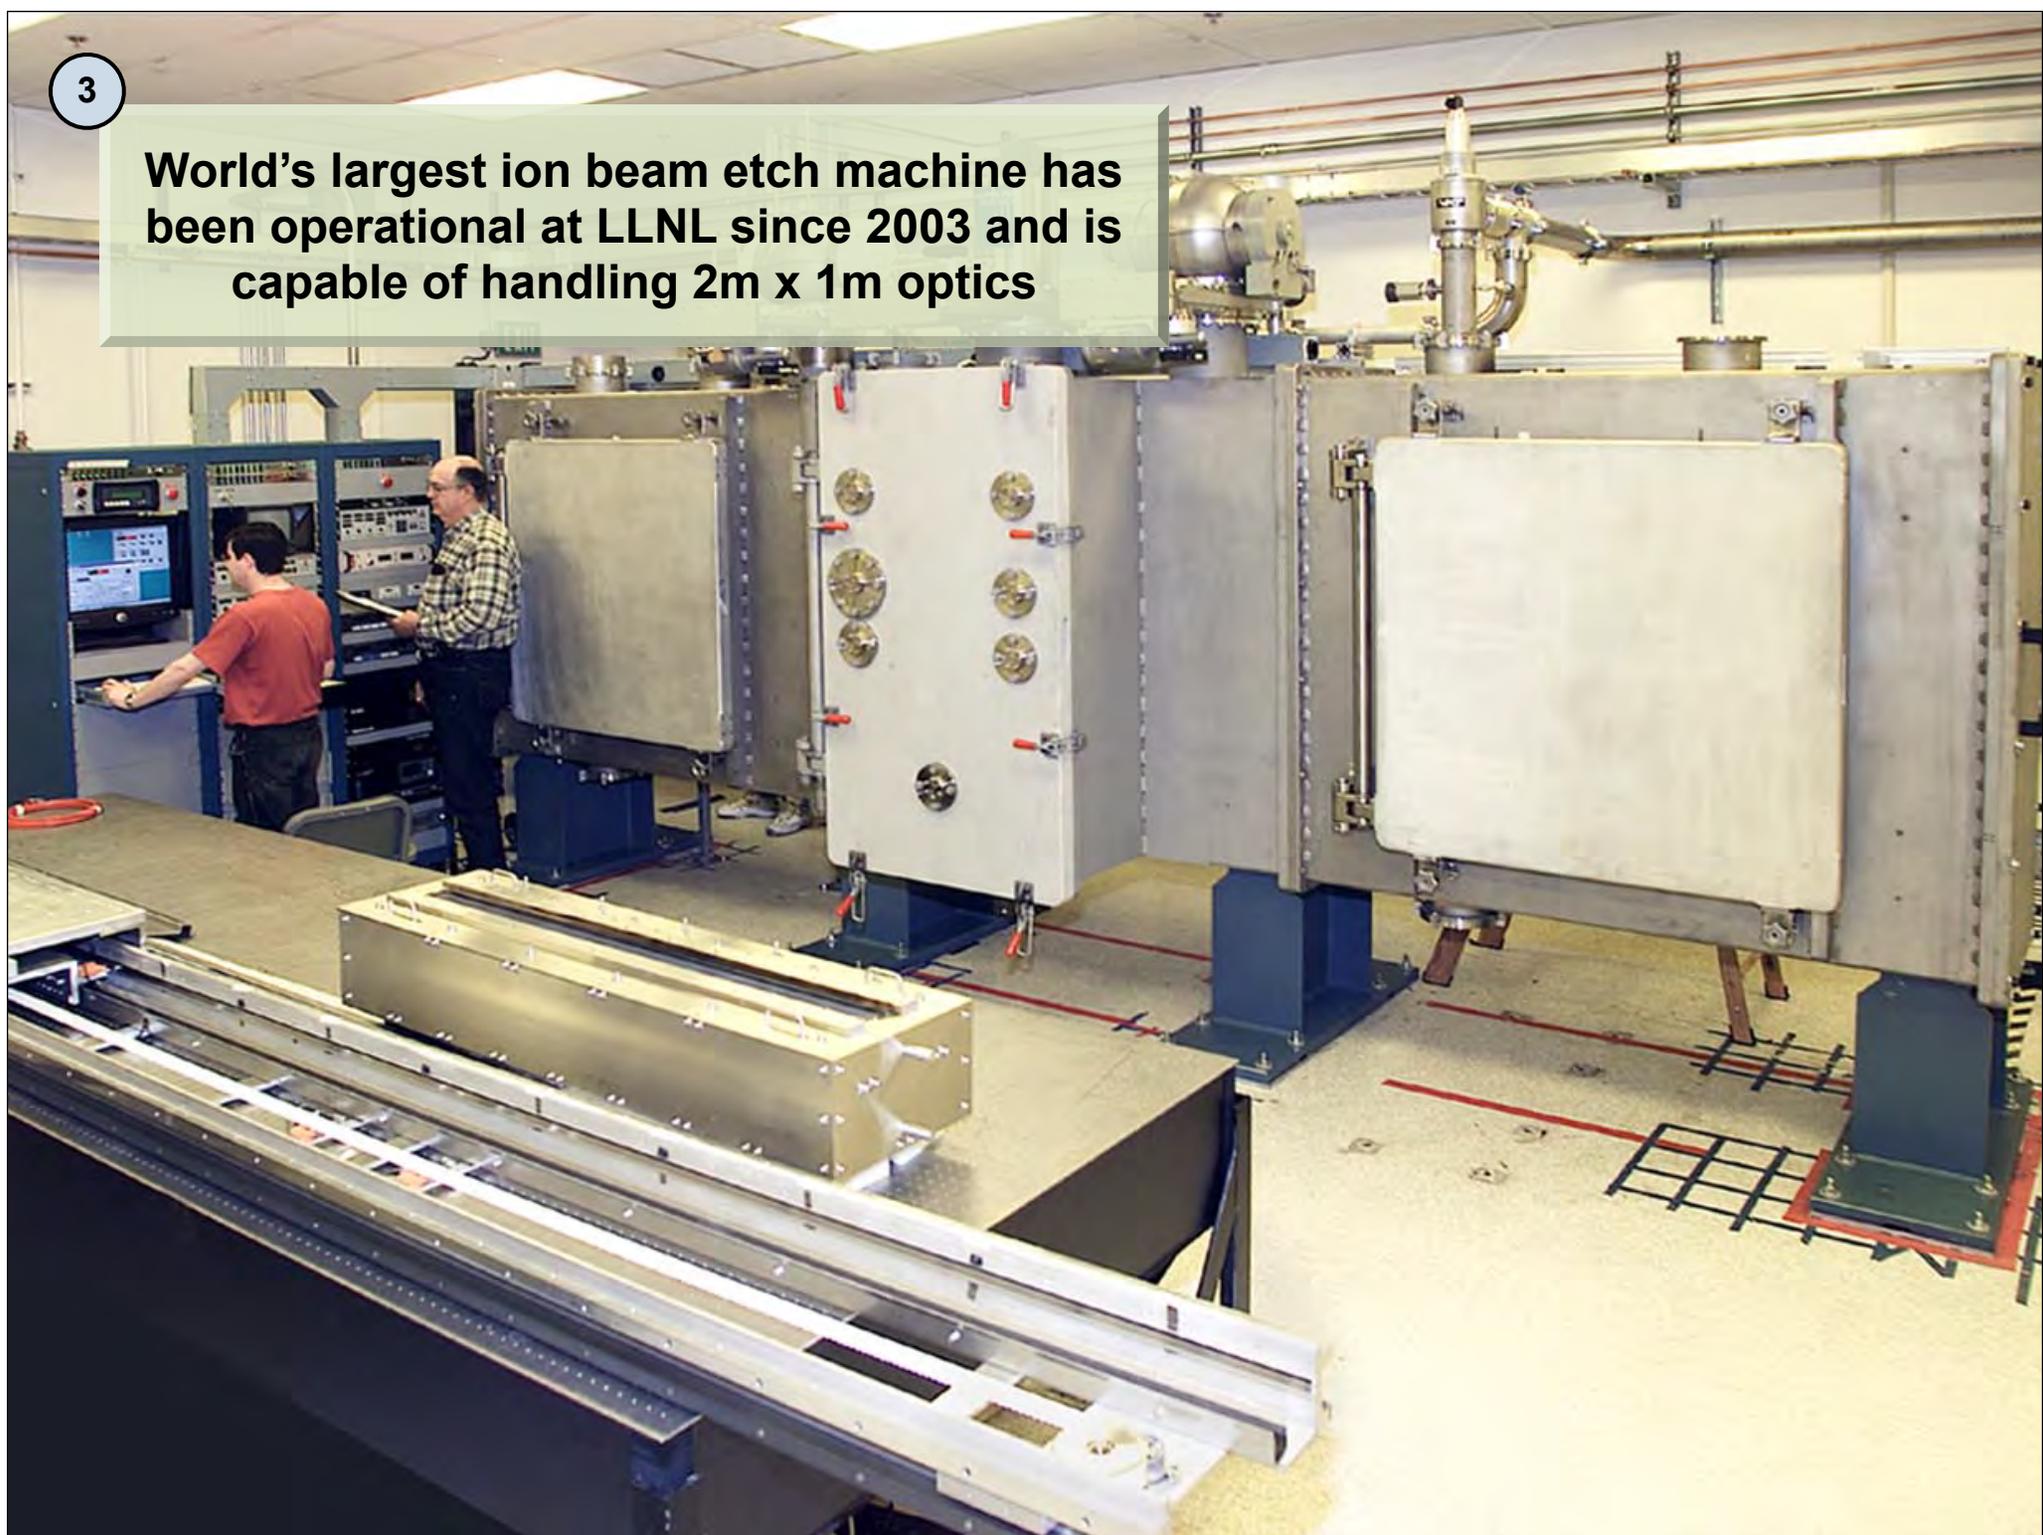

3

**World's largest holographic exposure station
has been operational at LLNL w/ 1100mm
diameter optics since 1997**

3

World's largest ion beam etch machine has been operational at LLNL since 2003 and is capable of handling 2m x 1m optics

3

Installation of the ARC compressor gratings is complete for the first compressor vessel

3

Volatile organic compound (VOC) cleanliness is extremely important

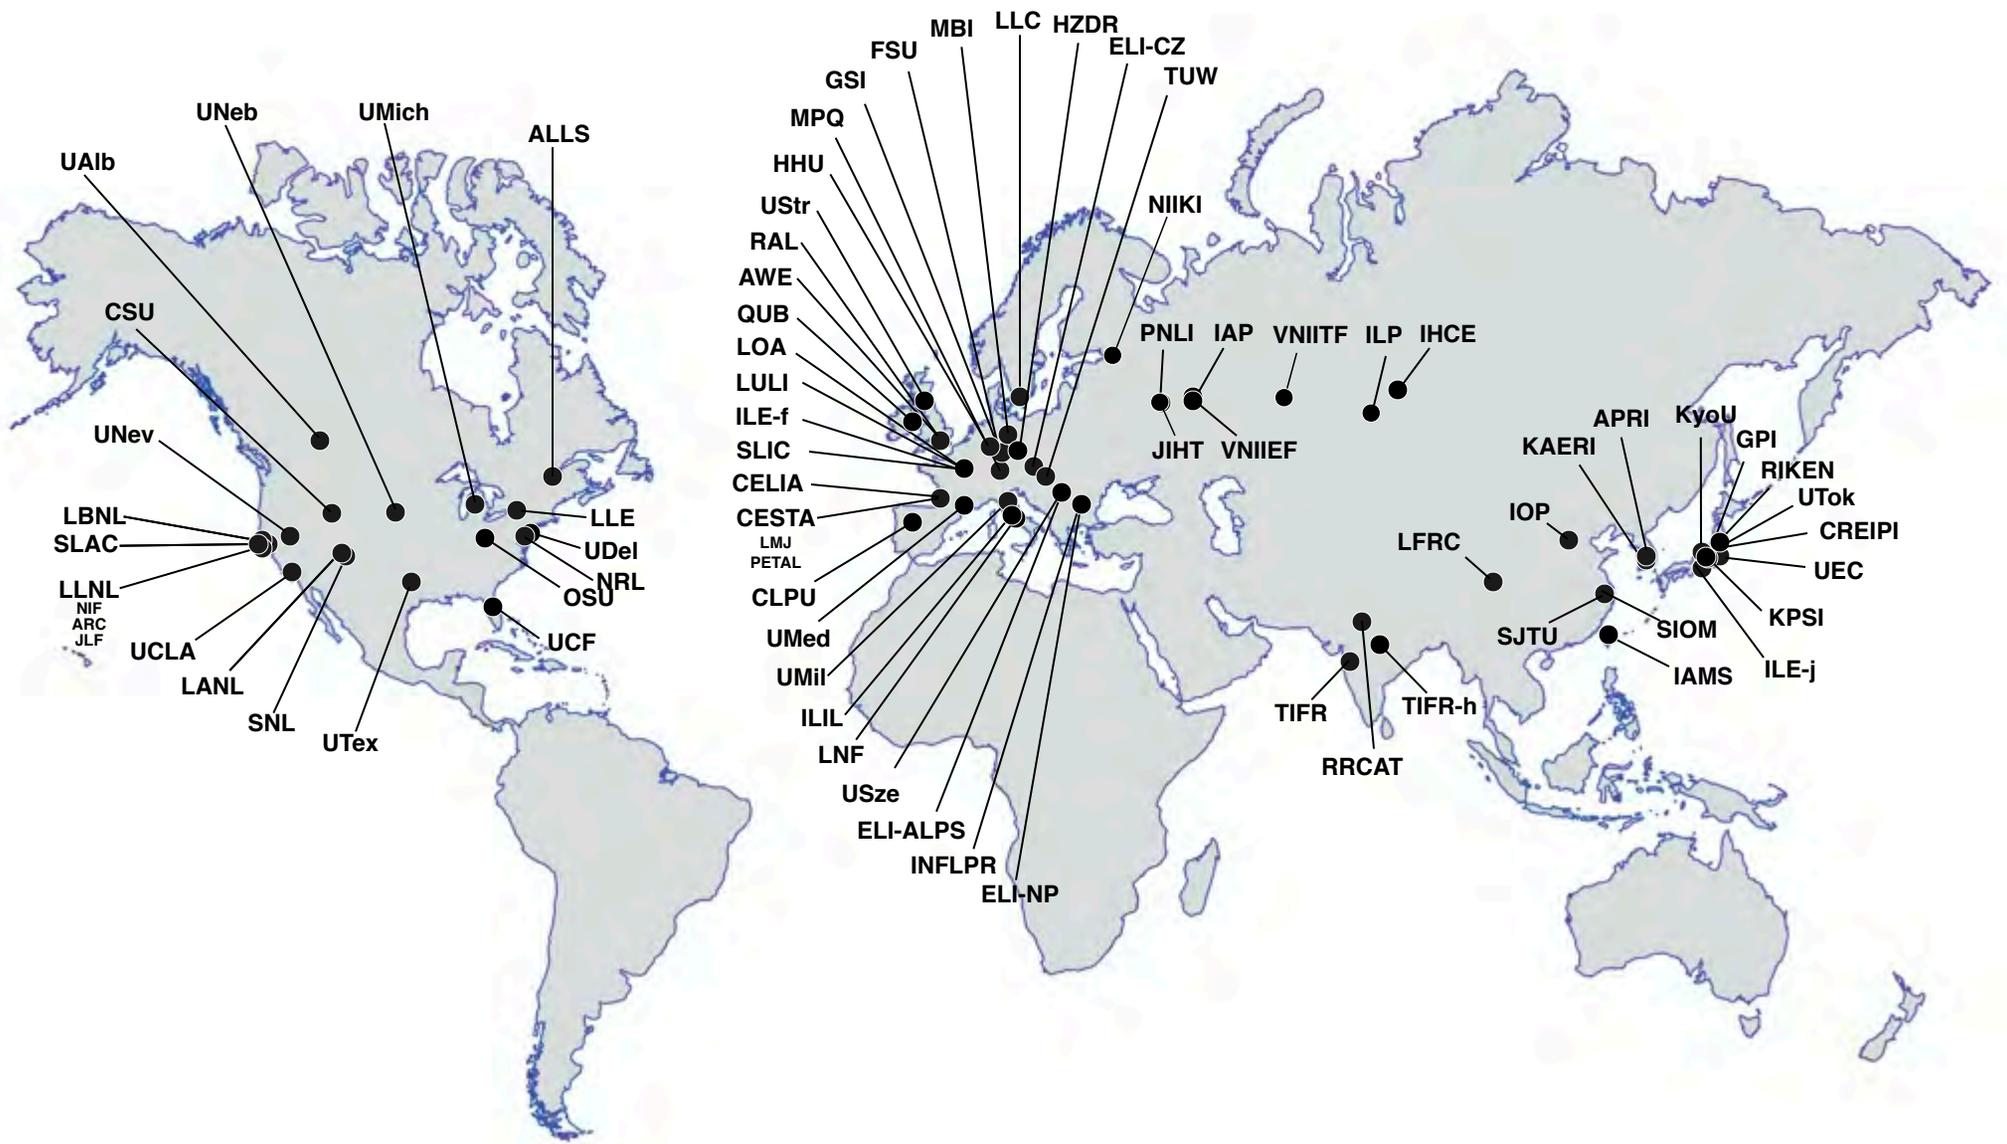

Vacuum system	Witness transmission change after 5 days exposure
LLNL Grating manufacturing facility	~0.01% (detection limit)
ARC compressor vessel 1	0.1%
ARC compressor vessel 2	0.1%
NIF target chamber	0.1%
Facility 1 (US)	2.4%
Facility 2 (US)	0.6%
Facility 3 (US)	2.1%
Facility 4 (Europe)	1.7%
